NICE $\aleph_1$ GENERATED NON-$P$-POINTS, I

SAHARON SHELAH

Abstract. We define a family of non-principal ultrafilters on $\mathbb{N}$ which are, in a sense, very far from $P$-points. We prove the existence of such ultrafilters under reasonable conditions. In subsequent articles we shall prove that such ultrafilters may exist while no $P$-point exists. Though our primary motivations came from forcing and independence results, the family of ultrafilters introduced here should be interesting from combinatorial point of view too.

1. Introduction

One of important notions in general topology and set theory of the reals is that of a $P$-point. Recall that a $P$-point is a non-principal ultrafilter $D$ on $\mathbb{N}$ with the property that for any countable family $\mathcal{A} \subseteq D$ there is a $B \in D$ almost (modulo finite) included in all $A \in \mathcal{A}$ (see Definition 3.6(2)). Concerning these and other special ultrafilters on $\mathbb{N}$, their history and basic applications we refer the reader to the survey article by Blass [1].

In many applications it is important to preserve $P$-points by specific forcing notions and by a forcing iterated with countable supports. Recall that preservation of an ultrafilter means that the ultrafilter from the ground model $V$ generates an ultrafilter in the generic extension $V[G]$ (see [2, Chapter VI]). We have a very good understanding of these questions and many relevant results have been presented in the literature. From our point of view the $P$-points are tractable for independence results because:

$\exists_1$ (A) there are quite many forcing notions preserving $P$-points,
(B) a proper forcing notion $Q$ which preserves “$D$ is an ultrafilter” preserves its being a $P$-point,
(C) the preservation of $P$-points is preserved in limits of CS iterations (together these give a well controlled way to have ultrafilters generated by $\aleph_1 < 2^{\aleph_0}$ sets),
(D) We can destroy a $P$-point by forcing, i.e., ensure it has no extension to a $P$-point (and consequently we may prove the consistency of “there are no $P$-points”),
(E) moreover, we can “split hairs”, i.e., destroy some $P$-points while preserving other, so we can have unique $P$-point up to isomorphisms.

For more details we refer the reader to [2, Ch.VI and Ch.XVIII,§4].

We may wonder if the theory developed for $P$-points can be repeated for other ultrafilters. We may ask:

1991 Mathematics Subject Classification. MSC 2010: Primary 03E05,54A24; Secondary: 03E35, 03E17, 54A35.

Key words and phrases. set theory, general topology, ultrafilters, $P$-point, forcing.
Question 1.1. (1) Are there other types of ultrafilters preserved by CS iterations of suitable forcing notions?

(2) In particular, we are interested in preservation of our ultrafilters at limit stages of CS iterations: for a limit ordinal \( \delta \), having been preserved by \( P_\alpha \) for \( \alpha < \delta \), does this hold for \( P_\delta \) when \( \langle P_\alpha, Q_\beta : \alpha \leq \delta, \beta < \delta \rangle \) is a CS iteration of proper forcing notions?

We suggested this problem in [3, 3.13] and we speculated about it there. Note that ultrafilters as in Question 1.1 for CS iterations are naturally generated by \( \aleph_1 \) sets; moreover CS iterations are mainly interesting when we start with CH, and “preserve an ultrafilter” is meaningful only when we add reals, naturally \( \aleph_2 \) ones. We suspect this direction is related to the question on the existence of a point of van Dowen [4] (see \( \exists_2(A) \) below), but at present we do not know neither if they are related nor how to answer it. Other specific problems that we have in mind when developing the theory for Question 1.1 are a problem of Nyikos and a problem of Dow:

\[ \exists_2 (A) \]  
[ E. van Dowen] Is it consistent that: there is no ultrafilter \( D \) on \( \mathbb{Q} \) such that every \( A \in D \) contains a member of \( D \) which is a closed set with no isolated points?

\[ \exists_2 (B) \]  
[P. Nyikos] Is it consistent to have some ultrafilter \( D \in \beta^+(\mathbb{N}) \setminus \mathbb{N} \) of character \( \aleph_1 \), but no \( P \)-point?

\[ \exists_2 (C) \]  
[A. Dow] Is it consistent to have \( u = \aleph_1 \), there is a \( P \)-point \( D \), but no \( P \)-point \( D \) with \( \chi(D) = \aleph_1 \)?

In the series of papers started here the main points are:

\[ \exists_3 (A) \]  
we have an involved family of sets (really well founded trees) appearing in the definition,

\[ \exists_3 (B) \]  
each ultrafilter has no \( P \)-point as a quotient,

\[ \exists_3 (C) \]  
they are related to a game,

\[ \exists_3 (D) \]  
such systems exists assuming, e.g., ♦\( \aleph_1 \),

\[ \exists_3 (E) \]  
enough relevant forcing notions preserve such systems, in particular, some serving \( \exists_1(C) \), so answering Question 1.1(1),

\[ \exists_3 (F) \]  
we have a preservation theorem for such ultrafilters under CS iterations.

\[ \exists_3 (G) \]  
As an application, we will solve Nyikos’ problem \( \exists_2(B) \).

So problems 1.1 and \( \exists_2(B) \) will be resolved by the methods we start developing here, but presently not \( \exists_2(A,C) \) (a problem of van Dowen and a problem of Dow).

In the present article we define ultrafilters analogous to \( P \)-points but with no \( P \)-point as a quotient; this is done in Sections 2 and 3. In the fourth section we deal with basic connections to forcing that we will use in the independence results in subsequent papers.

In the second paper of the series (presently the first half of [5]) we present these ultrafilters in a more general framework and deal with sufficient conditions for such an ultrafilter to generate an ultrafilter in a suitable generic extension. For the limit case we continue the proof of preservation theorems in [2], in particular [2, Ch.VI.1.26.1.27] and Case A with transitivity of [2, Ch.XVIII,§3]. For the successor case we need that the relevant forcing preserves our ultrafilters. We will conclude with the proof for \( \text{CON}(u = \aleph_1 + \text{no } P \text{-points}) \).
In the third part (currently the second half of [5]) we note that the ultrafilters so far were really analogous to selective (i.e., Ramsey) ultrafilters and give a more general framework which also includes $P$–points.

**Remark 2.2.**

1. There may be $P$-point while $\mathfrak{d} > \aleph_1$, see Blass and Shelah [6] and references there, but the existence of ultrafilters in the direction here, far from $P$-point, implies $\mathfrak{d} = \aleph_1$, see the survey of Blass [1]. But note that the ultrafilter may be $\aleph_1$-generated in a different sense: union of $\aleph_1$ families of the form $\text{fil}(B) \cap \mathcal{P}(\text{max}(B))$.

2. Note that it may be harder (than in the $P$-point case) to build such ultrafilters as here which are $\mu$-generated instead of $\aleph_1$-generated because of the unbounded countable depth involved. We have not looked at this as well as at the natural variants of our definition (not to speak of generalization to reasonable ultrafilters, see [7] and Roslanowski and Shelah [8, 9]).

### 2. System of filters using well founded trees

**Notation 2.1.** Here, $M = (M, <_M)$ is a partial order and $B$ is a subset of $M$ inheriting its order.

1. For $\eta \in B$ we let $B_{\geq \eta} = \{ \nu \in B : \eta <_M \nu \}$ and similarly $B_{> \eta}$. We also define

$$\text{suc}_B(\eta) = \{ \nu \in B : \eta <_M \nu \} \text{ but for no } \rho \in B \text{ do we have } \eta <_M \rho <_M \nu \}$$

and $\max(B) = \{ \nu \in B : B \cap M_{>\nu} = \emptyset \}$.

2. We say that $Y$ is a front of $B \subseteq M$ when $Y \subseteq B$ and every branch (maximal chain) of $B$ meets $Y$ and the members of $Y$ are pairwise $<_M$-incomparable.

**Definition 2.2.** Let $M = (M, <_M)$ be a partial order.

1. A set $B \subseteq M$ is a CWT sub-tree of $M$ if the following conditions (a)–(f) are satisfied (CWT stands for countable well-founded).

   a. $B$ is a countable subset of $M$.
   b. $B$ has a $<_M$-minimal member called its root, $\text{rt}(B)$.
   c. $B$, i.e., $(B,<_M | B)$ is a tree with $\leq \omega$ levels and no $\omega$-branch (so all chains in $B$ are finite).
   d. For each $\nu \in B$ the set $\text{suc}_B(\nu)$ is either empty or infinite.
   e. If $\eta, \nu \in B$ are $<_M$-incomparable, then they have no common $\leq_M$-upper bound (i.e., they are incompatible, $\eta \parallel_M \nu$).
   f. If $\nu \in B \setminus \max(B)$ and $F \subseteq M \setminus M_{<\nu}$ is finite, then for infinitely many $\rho \in \text{suc}_B(\nu)$ we have $(\forall \rho \in F)(\rho \parallel_M \eta)$.

The family of all CWT sub-trees of $M$ is denoted by $\text{CWT}(M)$.

2. For $B \in \text{CWT}(M)$ let $\text{frt}(B)$ be the set of all fronts of $B$, which in this case means the family of all maximal sets of pairwise incomparable members of $B$.

(2A) For antichains $Y_1, Y_2$ of $M$ we say that $Y_2$ is above $Y_1$ when

$$\forall \eta \in Y_2)(\exists \nu \in Y_1)[\nu \leq_M \eta]$$

and this will be used mainly for $Y_1, Y_2 \in \text{frt}(B), B \in \text{CWT}(M)$.

(2B) For $Y_1, Y_2$ as above let the projection $h_{Y_1,Y_2}$ be the unique function $h : Y_2 \rightarrow Y_1$ such that $h(\eta) \leq_M \eta$ for $\eta \in Y_2$. 

(2C) If \( Y_1, Y_2 \in \text{frt}(B) \) then \( Y_2 \) is almost above \( Y_1 \) when for some \( B' \in \text{sb}(B) \), see (3) below, \( B' \cap Y_2 \) is above \( B' \cap Y_1 \). We also define the projection \( h_{Y_1,Y_2} \) as above, but its domain is not \( Y_2 \) but the set \( \{ \eta \in Y_2 : (\exists \nu \in Y_1)(\nu \leq_M \eta) \} \).

(2D) The default value of \( Y \in \text{frt}(B) \) is \( \max(B) = \{ \nu \in B : \nu \text{ is } <_M \text{-maximal in } B \} \).

(3) Let \( B \in \text{CWT}(M) \). We say that \( B' \) is an exhaustive subtree of \( B \) when:

(a) \( B' \in \text{CWT}(M), B' \subseteq B \), and

(b) \( \text{rt}(B') = \text{rt}(B) \), and

(c) if \( \nu \in B' \) then \( \text{suc}_B(\nu) \subseteq \text{suc}_B(\nu) \) and \( \text{suc}_B(\nu) \) is finite.

We let \( \text{sb}(B) \) be the set of all exhaustive subtrees \( B' \) of \( B \).

(3A) For \( B \in \text{CWT}(M) \) and \( Y \in \text{frt}(B) \) let \( E_{B,Y} \) be the filter on \( Y \) generated by the family

\[ \{ Y \cap B' : B' \text{ is an exhaustive subtree of } B, \text{ i.e., } B' \in \text{sb}(B) \} \].

(3B) For \( B \) as above and \( Y \subseteq B \) let \( B[\leq Y] = \{ \nu \in B : (\exists \eta \in Y)(\nu \leq_M \eta) \} \).

(3C) In part (3), we say \( \nu \) witnesses \( "B' \in \text{sb}(B)" \) if \( f : \text{frt}(B) \to [B]^{<\omega} \) satisfies

\[ \nu \in B' \} \max(B) \Rightarrow \text{suc}_B(\nu) \subseteq \text{frt}(B) \).

Note that for \( f \) being a witness only \( f[B'] \) matters; in fact only \( f[B'][\leq Y] \) matters when we are interested in \( D_{B,Y} \).

(3D) For \( B \in \text{CWT}(M) \) let \( \text{psb}_M(B) \) ("p" stands for positive) be the set of positive subtrees \( B' \) of \( B \) which means (a),(b) as in part (3) above and (c)' if \( \nu \in B' \max(B) \), then \( \text{suc}_B(\nu) \) is an infinite subset of \( \text{suc}_B(\nu) \).

(4) An antichain \( Y \subseteq M \) is an almost front of \( B \) if for some \( B' \in \text{sb}(B) \) the intersection \( Y \cap B' \) is a front of \( B' \). Let \( \text{alm-frt}(B) = \text{alm-frt}_M(B) \) denote the set of all almost fronts of \( B \).

(4A) For \( Y \in \text{alm-frt}_M(B) \) let

\[ \text{fil}_M(Y,B) = \{ X \subseteq Y : \text{ for some } B' \in \text{sb}(B) \text{ we have } X \supseteq B' \cap Y \} \].

(5) Let \( \leq_M \) be the following two-place relation (actually a partial order) on \( \text{CWT}(M) \):

\[ B_1 \leq_M B_2 \text{ iff } (B_1, B_2 \in \text{CWT}(M) \text{ and) } \text{rt}(B_1) = \text{rt}(B_2) \text{ and for some } B_2' \in \text{sb}(B_2), \text{ we have} \]

(a) \( B_2' \cap B_1 \in \text{psb}_M(B_1) \), and

(b) every almost front of \( B_2' \cap B_1 \) is an almost front of \( B_2 \).

The tree \( B_2' \) as above will be called a witness for \( B_1 \leq_M B_2 \).

(6) For \( B \in \text{CWT}(M) \), the depth of \( B \) is defined recursively by

\[ \text{Dp}(B) = \sup\{ \text{Dp}(B_{\geq \eta}) + 1 : \eta \in B \setminus \{ \text{rt}(B) \} \} \].

Remark 2.3. If \( B, B' \in \text{CWT}(M) \), \( B' \subseteq B \) and \( \nu \in B' \), then \( \text{suc}_B(\nu) \cap B' \subseteq \text{suc}_B(\nu) \), but the two sets do not have to be equal. Note that in the definitions of both \( B' \in \text{sb}(B) \) and \( B' \in \text{psb}_M(B) \), we do require that

\[ (\forall \nu \in B') (\text{suc}_B(\nu) \cap B' = \text{suc}_B(\nu)) \).

The condition (1) implies that if \( Y \subseteq B \) is a front of \( B \), then \( Y \cap B' \) is a front of \( B' \).

**Observation 2.4.** Let \( M \) be a partial order and \( B, B_1, B_2 \in \text{CWT}(M) \).

1. We have that \( B_1 \leq_M^* B_2 \) if and only if every almost front of \( B_1 \) is an almost front of \( B_2 \).
(2) The relation $\leq^*_M$ is a partial order on $\text{CWT}(M)$.
(3) If $B_2 \in \text{psb}_M(B_1)$, then $B_1 \leq^*_M B_2$ and $\text{psb}_M(B_2) \subseteq \text{psb}_M(B_1)$.
(4) If $B_2 \in \text{sb}(B_1)$, then $B_2 \in \text{psb}(B_1)$, $\text{sb}(B_2) \subseteq \text{sb}(B_1)$ and $B_1 \leq^*_M B_2 \leq^*_M B_1$.
(5) For $B \in \text{CWT}(M)$, $\max(B)$ is a front of $B$ and also $\{\text{rt}(B)\}$ is. If $B \neq \{\text{rt}(B)\}$, then $\text{sup}_{\text{CWT}(B)}(\text{rt}(B))$ is a front of $B$.
(6) Every front of $B \in \text{CWT}(M)$ is an almost front of $B$.
(7) If $B \in \text{CWT}(M)$ then $\text{Dp}(B)$ is a countable ordinal and $B \geq_\eta \in \text{CWT}(M)$ for all $\eta \in B$.
(8) If $Y \subseteq B \setminus \{\text{rt}(B)\}$ is a front of $B$, and $\eta \in \text{sup}_{\text{CWT}(B)}(\text{rt}(B))$, then $Y \cap B \geq_\eta$ is a front of $B \geq_\eta$.
(9) If $Y$ is an almost front of $B$ and an antichain $Z$ is an almost front of $B \geq_\eta$ for every $\eta \in Y \cap B$, then $Z$ is an almost front of $B$.
(10) If $B_1 \leq^*_M B_2$ and $Y$ is a front of $B_1$, then there is $B'_2 \in \text{sb}(B_2)$ such that $Y \cap B'_2$ is a front of $B'_2$ and $(B_1) \geq_\eta \leq^*_M (B'_2) \geq_\eta$, for all $\eta \in Y \cap B'_2$.

Proof. Straightforward. □

**Definition 2.6.** Let $\mathbf{K}$ be the class of the objects $\mathbf{x} = (M_X, \prec_M, \mathcal{A}_x, \mathcal{B}_x, \leq_x)$ satisfying the following properties (a)–(h).

(a) $(M_X, \prec_M) = (M, \prec)$ is a partial order with the smallest element $\text{rt}_x = \text{rt}(x)$. Let $M^- = M_X \setminus \{\text{rt}_x\}$.
(b) $\mathcal{A}_x = \mathcal{A} = \langle \mathcal{A}_\eta : \eta \in M \rangle = \langle \mathcal{A}_\eta^x : \eta \in M_X \rangle$ and $\mathcal{A}_x = \bigcup \{\mathcal{A}_\eta : \eta \in M_X^\prec\}$.
(c) $\mathcal{A}_\eta \subseteq \text{CWT}(M)$, let $\mathcal{A}_\eta^x = \mathcal{A}_\eta \setminus \{\{\eta\}\}$.
(d) $\text{rt}(B) = \eta$ for every $B \in \mathcal{A}_\eta$.
(e) $\mathcal{A}_\eta$ is not empty, in fact $\{\eta\} \in \mathcal{A}_\eta$.
(f) $\mathcal{B}_x = \mathcal{A}_x^\prec \setminus \{\{\text{rt}_x\}\}$ and $\leq_x$ is a directed partial order on $\mathcal{B}_x$.
(g) $B_1 \leq^*_M B_2$ implies $B_1 \leq^*_M B_2$, see Definition 2.2(5) and, of course, $B_1, B_2 \in \mathcal{B}_x$.
(h) if $\nu \in B \in \mathcal{A}_\eta$ then $B \cap M^\geq_\nu \in \mathcal{A}_\eta$.

When dealing with $M_X, \mathcal{A}_x$, etc we may omit $x$ when clear from the context.

**Definition 2.6.** Let $\mathbf{x} \in \mathbf{K}$ and $\eta \in M_X$.

1. Let $\text{frt}(\eta) = \text{frt}_x(\eta) = \{Y : Y$ is a front of $B$ for some $B \in \mathcal{A}_\eta^x\}$ and instead of $\text{frt}(B)$ (see Definition 2.2(2)) we may write also $\text{frt}_x(B)$. We let $\text{frt}^{-1}(\eta) = \{Y \in \text{frt}(\eta) : Y \neq \{\eta\}\}$.

Omitting $\eta$ means $\eta = \text{rt}_x$.

2. Similarly, using Definition 2.2(4), we define $\text{almfrt}_x(\eta)$ (and $\text{almfrt}_x$).

3. Let $\nu \in \mathcal{A}^{\geq}_\eta$. We define

$$\text{Fin}(B) = \{f : f \text{ is a function with domain } B \setminus \text{max}(B) \text{ such that } f(\nu) \in [\text{sup}_{\text{CWT}(\nu)}]^{\leq_\nu} \text{ for all } \nu \in B \setminus \text{max}(B)\}.$$ 

and for $f \in \text{Fin}(B)$ we set

$$A_f = A_{B,f} = \{\eta \in B : (\forall \rho \in B \setminus \text{max}(B)) (\forall \nu \in \text{sup}_{\text{CWT}(\rho)} (\rho \leq M \eta \Rightarrow \rho \notin f(\rho))\}.$$ 

(Recall Definition 2.2(3C).)

4. Assume that $Y \in \text{almfrt}_x$. We let $D_Y = D^X_Y$ be the family

$$\{Z \subseteq Y : \text{for some } B \in \mathcal{B}_x \text{ and } B' \in \text{sb}(B) \text{ we have } Y \in \text{almfrt}(B) \text{ and } B' \cap Y \subseteq Z\}.$$
(5) If \( B \in \mathcal{P}_x \), then \( D_x(B) = D^x_{\max(B)} \).

(6) We let \( Dp_x(\eta) = \sup\{Dp(B) + 1 : B \in \mathcal{A}_x^\eta\} \) (recall Definition 2.2(6)).

If \( x \) is clear from the context, then we may omit the subscript/superscript \( x \) in the objects defined above.

Let us recall the definition of the Rudin—Keisler order on ultrafilters.

**Definition 2.7.** Let \( D_\ell \) be an ultrafilter on \( \mathcal{U}_\ell \) for \( \ell = 1, 2 \). We say \( D_1 \leq_{\text{RK}} D_2 \) iff there is a function \( h \) such that

- \( \text{Dom}(h) \subseteq D_2 \), \( \text{Rang}(h) \subseteq D_1 \) and
- \( A \subseteq D_1 \iff \{a \in \text{Dom}(h) : h(a) \in A\} \subseteq D_2 \) for every \( A \subseteq \mathcal{U}_1 \).

**Observation 2.8.** Assume \( x \in K \) and let \( B, B_1, B_2 \in \mathcal{P}_x \).

1. \( \{\text{rt}_x\} \in \text{frt}_x \) and \( D^x_{\{\text{rt}_x\}} = \{\{\text{rt}_x\}\} \).
2. If \( B_1 \leq_x B_2 \), \( f \in \text{Fin}(B_1) \) and \( Y \subseteq \text{alm-frt}(B_2) \) and there is \( g \in \text{Fin}(B_2) \) such that \( Y \cap A_{B_2,g} \subseteq Y \cap A_{B_1,f} \) and

\[
Y \cap A_{B_1,f} \subseteq Y \cap A_{B_1,f} \cap A_{B_2,f}.
\]

3. If \( Y \subseteq \text{alm-frt}(B_2), f \in \text{Fin}(B_1) \) (for \( \ell = 1, 2 \)), then there are \( B^* \in \mathcal{P}_x \) and \( g \in \text{Fin}(B^*) \) such that \( B_1 \leq_x B^*, B_2 \leq_x B^* \) and

\[
Y \cap A_{B_2,g} \subseteq Y \cap A_{B_1,f} \cap A_{B_2,f}.
\]

4. If \( Y \subseteq \text{alm-frt}_x \), then \( D^x_{Y} \) is a filter on \( Y \).
5. If \( B_1 \leq_x B_2, Y_1 \subseteq \text{alm-frt}(B_1) \), and \( Y_2 = Y_1 \cap B_2 \) (hence \( Y_2 \subseteq \text{alm-frt}(B_2) \)), then \( Y_2 \in D^{x}_{Y_1} \) and \( D^x_{Y_2} = D^x_{Y_1} \).
6. Assume that \( Y_1, Y_2 \subseteq \text{frt}(B) \) and \( Y_2 \) is above \( Y_1 \). Let \( h : Y_2 \to Y_1 \) be the projection, i.e.,

\[
h(\nu_2) = \nu_1 \iff \nu_1 \in Y_1 \land \nu_2 \in Y_2 \land \nu_1 \leq_{M_\nu} \nu_2.
\]

Then \( h(D_{Y_2}) = D_{Y_1} \), i.e., \( D_{Y_1} = \{A \subseteq Y_1 : h^{-1}[A] \subseteq D_{Y_2}\} \) (so \( h \) witnesses \( D_{Y_1} \leq_{\text{RK}} D_{Y_2} \)).

7. If \( B_1 \leq_x B_2 \) and \( Y_\ell = \text{succ}_{B_1}(\text{rt}_x) \) for \( \ell = 1, 2 \), then:
   (a) \( Y_1 \) is a front of \( B_1 \) and \( Y_1 \) is above \( Y_2 \), see Definition 2.2(2C),
   (b) if \( Y \) is a front of \( B_2 \) and it is not \( \{\text{rt}_x\} \), then \( Y \) is above \( Y_\ell \).

8. \( \max(B) \) is the maximal front of \( B \) which means that it is above any other.
9. If \( Q \) is an \( \omega \)-bounding forcing and \( B \in \mathcal{P}_x \), then for any \( B' \in \text{sb}(B)^{\nu}\), there is \( B'' \in \text{sb}(B)^{\nu} \) such that \( B'' \subseteq B' \).
10. If \( F \) is a finite subset of \( M_\nu \), \( B \in \mathcal{P}_x \), then there is a branch (i.e., a maximal chain) \( C \subseteq B \) such that

\[
(\forall \rho \in F)(\forall \sigma \in C)(\rho \not\in M_\sigma).
\]
11. If \( B \in \mathcal{A}_x \) and \( \nu \in B \setminus \max(B) \), then \( \text{id}_x(\nu, B) \) is a proper ideal ideal on \( \text{succ}_B(\nu) \).

**Proof.** Straightforward. \(\square\)

**Definition 2.9.** (1) For an (infinite) cardinal \( \kappa \) let \( K_{\leq \kappa} \) be the class of \( x \in K \) such that \( ||x|| := |M_\kappa| + \sum\{|\mathcal{A}_x^\eta : \eta \in M_\kappa\} < \kappa \), similarly \( K_{\leq \kappa} \).

(2) \( \leq \kappa \) is the following two-place relation on \( K \) (it is a partial order, see Observation 2.10 below): \( x \leq \kappa y \) if and only if
(a) $M_x \subseteq M_y$ (as partial orders) and, moreover, for any $\eta, \nu \in M_x$ we have

$$\nu \parallel_{M_x} \eta \quad \text{if and only if} \quad \nu \parallel_{M_y} \eta,$$

and

(b) $\eta \in M_x \Rightarrow \mathcal{A}_x^\mathcal{Y} \subseteq \mathcal{A}_y^\mathcal{Y}$, and

(c) $rt_y = rt_x$ (actually follows from (d)), and

(d) $\leq_{x} = \leq_{y}$ \[1\]

Lemma 3.1. $K$

Proof. \[1\]

Lemma 3.2. $K$

Proof. \[1\]

Lemma 3.3. $K$

Proof. \[1\]

3. Construction of Ultra-systems

Lemma 3.1. $K_{\leq R_0}$ is non-empty.

Proof. Define $x$ so that $M_x = \{\eta_\ast\}$, $\mathcal{A}_x^\mathcal{Y} = \{\{\eta_\ast\}\}$, $rt_x = \eta_\ast$. Now it is easy to check. \[1\]

Lemma 3.2. If $x \in K$ and $\eta \in M_x$ satisfies $|\mathcal{A}_x^\mathcal{Y}| = 1$, i.e., $\mathcal{A}_x^\mathcal{Y} = \{\{\eta\}\}$, then for some $y \in K$ we have $x \leq_k y$, $|\mathcal{A}_y^\mathcal{Y}| > 1$ and $\|y\| \leq \|x\| + R_0$.

Proof. Let $\langle \eta_\ast : n < \omega \rangle$ be pairwise distinct objects not belonging to $M_x$. We define $y$ by:

(a) $M_y$ has set of elements $M_x \cup \{\eta_\ast : n < \omega\}$,

(b) $\nu <_{M_x} \rho$ if and only if $\nu <_{M_x} \rho$ or $\nu \leq_{M_x} \eta \wedge (\exists n)(\rho = \eta_n)$,

(c) $\mathcal{A}_y^\mathcal{Y}$ is:

$$\langle \{\eta\} \rangle$$ when $\nu \in M_x \setminus \{\}\$,

$$\langle \{\eta\}, \{\eta : n < \omega\} \cup \{\}\$ when $\nu = \eta$, and

$$\langle \{\eta_n\}\rangle$$ when $\nu = \eta_n$,

(d) the order $\leq_y$ is $\leq_{x}$ if $\eta \neq rt_x$, and it is determined by $\{\eta\} \leq_{y} \{\eta_n : n < \omega\} \cup \{\eta\}$ if $\eta = rt_x$.

Now check. \[1\]

Lemma 3.3. If $x \in K_{\leq R_0}$ then for some $y \in K_{\leq R_0}$ we have $x \leq_k y$ and in $\mathcal{B}_y$ there is a $\leq_{y}$-maximal member.
(2) If $x \in K_{\leq n_0}$ and some $B \in \mathcal{B}_x$ is $\leq_x$-maximal then for some $y \in K_{\leq n_0}$ and $B' \in \mathcal{B}_y$ we have $x \leq K y$ and $B <_y B'$.

(3) If $x \in K_{\leq n_0}$, $\eta \in M_x$, $B_1 \in \mathcal{A}_n^{\eta}$, $B_2 \in \text{psb}_{M_x}(B_1)$ and
$$\eta = rt_x \Rightarrow B_1 \text{ is } \leq_x\text{-maximal},$$
then there is $y \in K_{\leq n_0}$ such that $x \leq K y$ and $B_2 \in \mathcal{A}_y^{\eta}$.

(4) If $x \in K_{\leq n_0}$, $B_1 \in \mathcal{B}_x$ and $B_2 \in \text{sb}(B_1)$, then there is $y \in K_{\leq n_0}$ such that $x \leq K y$ and $B_2 \in \mathcal{B}_y$.

Proof. 1) If in $(\mathcal{B}_x, \leq_x)$ there is a maximal member then we let $y = x$. Otherwise, as it is directed (see clause (f) of Definition 2.5) and $\|x\| \leq n_0$ (because $x \in K_{\leq n_0}$), there is a strictly $\leq_x$-increasing cofinal sequence $\langle B_n : n < \omega \rangle$. Let $Y_n = \text{ suc}_{B_n}(rt_x)$.

Note that for each $m_1 < m_2$, $Y_{m_1} \cap B_{m_2}$ is an almost front of $B_{m_2}$ (so also it is almost above $Y_{m_2}$). Hence for $m_1 < m_2 \leq n$ we have that $Y_{m_1} \cap B_n$ is an almost front of $B_n$, which is almost above $Y_{m_2} \cap B_n$. Consequently we may choose $B_n^* \in \text{sb}(B_n)$ such that each $Y_\ell \cap B_n^*$ is a front of $B_n^*$ and $Y_\ell \cap B_n^*$ is above $Y_{\ell+1} \cap B_n^*$ for all $\ell < n$. Moreover, we may also require that

$$(\circ)_0 \text{ for each } \ell < n \text{ and } Y_\ell \cap B_n^* \text{ we have } (B_\ell)_{\geq \eta} \leq^{\ast}_{M_x} (B_n^*)_{\geq \eta}$$

(remember Observation 2.4(10)).

Fix a list $\{\nu_\ell : \ell < \omega\}$ of all members of $M_x$ (possibly with repetitions). By induction on $n < \omega$ choose $\nu_n$ such that

$$(\circ)_1 \begin{array}{ll}
(a) & \nu_n \in Y_n \cap B_n^* = \text{ suc}_{B_n^*}(rt_x), \\
(b) & \text{if } \ell < n, \text{ then } \nu_n, \nu_\ell \text{ are } <_{M_x}\text{-incompatible (i.e., } \nu_\ell \parallel M_x \nu_n), \\
(c) & \text{if } \ell < n \text{ and } \nu_\ell \neq rt_x, \text{ then } \nu_\ell \parallel_{M_x} \nu_n.
\end{array}$$

[Why is the choice possible? By the demand (f) of Definition 2.2(1) applied to $\nu = rt_x$ and $F = \{\nu_\ell, \rho_\ell : \ell < n\} \setminus \{rt_x\}.$]

We define
$$B^* = \{rt_x\} \cup \bigcup \{B_n^* \cap (M_x)_{\geq \nu_n} : n < \omega\}.$$ 

Now, $$(\circ)_2 B^* \in \text{CWT}(M_x) \text{ is a tree with root } rt_x \text{ and } \text{suc}_{B^*}(rt_x) = \{\nu_n : n < \omega\}.$$ 

[Why? It should be clear that conditions (a)–(e) of Definition 2.2(1) hold, $rt(B^*) = rt_x$ and $\text{suc}_{B^*}(rt_x) = \{\nu_n : n < \omega\}$. To verify clause (e) suppose $\eta, \nu \in B^*$ are $<_{M_x}$-incomparable. Then both $\eta \neq rt_x$ and $\nu \neq rt_x$, so $\eta, \nu \in \bigcup \{B^*_{\rho} : \rho \neq rt_x\}$. If, for some $n$, we have $\eta, \nu \in B_n^* \cap (M_x)_{\geq \nu_n}$, then they are $<_{M_x}$-incompatible as $B_n^* \subseteq B_n$ and $B_n$ satisfies 2.2(1)(e). Otherwise, for some distinct $\ell, n$ we have $\eta \in B_\ell^* \cap (M_x)_{\geq \nu_\ell}$ and $\nu \in B_n^* \cap (M_x)_{\geq \nu_n}$. Now, if we could find $\rho \in M_x$ such that $\rho \geq_{M_x} \eta$ and $\rho \geq_{M_x} \nu$, then $\eta, \nu$ would be compatible contradicting $(\circ)_1(b)$. $B^*$ indeed satisfies clause (e) of Definition 2.2(1). Finally, to verify (f) suppose $\nu \in B^* \setminus \max(B^*)$ and $F \subseteq M_x \setminus (M_x)_{\leq B^*}$ is finite. If $\nu_n \leq_{M_x} \nu$ for some $n$, then the properties of $B_n^*$ apply. So suppose $\nu = rt_x$. Choose $m$ so that $F \subseteq \{\rho_\ell : \ell < m\}$ and use condition $(\circ)_1(c)$ to argue that for all $n \geq m$ and $\rho \in F$ we have $\nu_n ||_{M_x} \rho$.]

Also,

$$(\circ)_3 B \leq_{M_x} B^* \text{ for all } B \in \mathcal{B}_x.$$ 

[Why? Since $\leq^{\ast}_{M_x}$ is a partial order and by the choice of $B_n$, it is enough to show that for each $n < \omega$ we have $B_n \leq^{\ast}_{M_x} B^*$; i.e., that every almost front of $B_n$ is an almost front of $B^*$. To this end suppose that $Z \subseteq B_n$ is an almost front of $B_n$ for
some \( n < \omega \). If \( Z = \{ \text{rt}_x \} \), then there is nothing to do, so suppose \( Z \subseteq \text{B}_n \setminus \{ \text{rt}_x \} \), i.e., \( Z \subseteq \bigcup \{ (\text{B}_n)_{\geq \rho} : \rho \in \text{Y}_n \} \). Plainly, the set

\[
X = \{ \rho \in \text{Y}_n : \text{Z is not an almost front of } (\text{B}_n)_{\geq \rho} \}
\]

is finite and hence for some \( m > n \) we have \( X \subseteq \{ \rho_k : \ell < m \} \). Then for every \( k > m \) we have:

(a) \( \nu_k \) is incompatible with every \( \nu \in X \),
(b) \( Y_n \cap (\text{B}_k)_{\geq \nu_k} \) is a front of \((\text{B}_k)_{\geq \nu_k}\),
(c) \( (\text{B}_n)_{\geq \eta} \leq \text{M} \leq (\text{B}_k)_{\geq \eta} \) for every \( \eta \in Y_n \cap (\text{B}_k)_{\geq \nu_k} \) (by \((\odot)_9\)),
(d) \( Z \cap (\text{B}_n)_{\geq \eta} \) is an almost front of \((\text{B}_n)_{\geq \eta} \) for every \( \eta \in Y_n \cap (\text{B}_k)_{\geq \nu_k} \), and hence

(e) \( Z \cap (\text{B}_k)_{\geq \eta} \) is an almost front of \((\text{B}_k)_{\geq \eta} \) for every \( \eta \in Y_n \cap (\text{B}_k)_{\geq \nu_k} \).

(f) Finally, \( Z \) is an almost front of \((\text{B}_k)_{\geq \nu_k} \) (by Observation 2.4(9) and (b)+(e)).

Since \( \text{sup} \text{rt}_x = \{ \text{rt}_k : k < \omega \} \), we know that \( \{ \nu_k : m < k < \omega \} \) is an almost front of \( B^* \). Therefore, by Observation 2.4(9) and (f), we conclude that \( Z \) is an almost front of \( B^* \).

Lastly, we define \( y \):

\((\odot)_4\) (a) \( (\text{M}_y, <_{\text{M}_y}) = (\text{M}_x, <_{\text{M}_x}) \),
(b) \( \nu^y = \nu^x \) when \( \nu \in \text{M}_x \setminus \{ \text{rt}_x \} \), and \( \nu^y_{\text{rt}_x} = \nu^x_{\text{rt}_x} \cup \{ B^* \} \),
(c) \( B_1 \leq_y B_2 \) if and only if \( B_1 \leq_x B_2 \) or \( B_1 \in \text{A} \setminus \text{B}_2 = B^* \).

It should be clear that \( y \in \text{K}_{\leq \text{K}_0} \) as required.

(2,3,4) Straightforward; see also Lemmas 3.4, 3.5 below.

\[ \square \]

**Lemma 3.4.** Assume that \( x \in \text{K}_{\leq \text{K}_0} \) and \( B \in \text{R}_x \) is \( \leq_x \)-maximal. Then for some \( y \in \text{K}_{\leq \text{K}_0} \) and \( B' \in \text{R}_y \) we have

(a) \( x \leq y \), \( M_x = M_y = M \) and
(b) \( B' \in \text{R}_y \) is \( \leq_y \)-maximal,
(c) if \( \nu \in B' \setminus \text{max}(B') \) and \( \rho \in M \setminus M_{\leq \nu} \), then for all but finitely many \( \varrho \in \text{sup}(\nu) \) we have \( \rho \parallel \varrho \).

**Proof.** Fix a list \( \{ \rho_k : \ell < \omega \} \) of all members of \( M_x \) (possibly with repetitions). For each \( \eta \in B \setminus \text{max}(B) \) by induction on \( n < \omega \) we choose \( \nu_{\eta,n} \) such that \((\sqcap)_1\) (a) \( \nu_{\eta,n} \in \text{sup}(\eta) \),
(b) \( \nu_{\eta,n} \parallel \nu_{\eta,k} \) for \( k < n \) (and hence \( \nu_{\eta,n} \parallel \nu_{\eta,k} \) for \( k < n \)),
(c) if \( k < n \) and \( \rho_k \notin M_{\leq \eta} \), then \( \rho_k \parallel \nu_{\eta,n} \).

Next, by downward induction on \( \eta \in B \) we define

\( B_\eta = \bigcup \{ B_{\nu_{\eta,n}} : n < \omega \} \cup \{ \eta \} \).

Lastly we define \( y \) so that:

\((\text{M}_y, <_{\text{M}_y}) = (\text{M}_x, <_{\text{M}_x}) \),
\( \nu^y = \nu^x \) if \( \eta \in \text{M}_x \) but \( \eta \notin B \setminus \text{max}(B) \), and
\( \nu^y_{\text{rt}_x} = \nu^x_{\text{rt}_x} \cup \{ B_\eta \} \) if \( \eta \in B \setminus \text{max}(B) \),
\( \text{R}_y = \text{R}_x \cup \{ B_{\text{rt}_x} \} \) and for \( B', B'' \in \text{R}_y \) we let: \( B' \leq_y B'' \) if and only if \( B' \leq_x B'' \) or \( B'' = B_{\text{rt}_x} \).

\[ \square \]

**Lemma 3.5.** (1) If \( x \in \text{K}_{\leq \text{K}_0} \), \( Y \in \text{alm-fr}_x \) and \( Z \subseteq Y \) then for some \( y \in \text{K}_{\leq \text{K}_0} \) we have \( x \leq y \) and either \( Z \in D_y^* \) or \( (Y \setminus Z) \in D_y^* \).
Moreover, if $h$ is a function with domain $Y$, then above we can demand that for some $B \in \mathcal{B}_X$, $Y \cap B$ is a front of $B$ and for some front $Y'$ of $B$ which is below $Y$ and a one-to-one function $h'$ with domain $Y'$ we have
\[ \rho \in Y' \cap \mathcal{B}_X \cap \rho \leq M \Rightarrow h(\rho) = h'(\rho). \]
(Note that possibly $Y' = \{\text{rt}_Y\}$ and then $h'(Y \cap B)$ is constant.)

**Proof.**

1) By Lemma 3.3(1) without loss of generality there is $B \in \mathcal{B}_X$ such that $B$ is $\leq_X$-maximal in $\mathcal{B}_X$; clearly $Y \cap B$ is an almost front of $B$ and so without loss of generality $Y \subseteq B$.

We know that $B[\leq Y] := \{\rho \in B : (\exists \nu)[\rho \leq M \nu \in Y]\}$ has no $\omega$-branch, so by $\prec_M$-downward induction on $\nu \in B[\leq Y]$ we choose $(t_\nu, Y_\nu)$ such that (where $M = M_X$, of course):

(a) $t_\nu \in \{0, 1\}$ and
   - if $t_\nu = 1$, then $Y_\nu \subseteq M_{\geq \nu} \cap Z$,
   - if $t_\nu = 0$, then $Y_\nu \subseteq M_{\geq \nu} \cap (Y \setminus Z)$,
(b) $Y_\nu = \text{max}(B'_\nu)$ for some $B'_\nu \in \text{psb}_M(B_{\geq \nu})$,
(c) if $\nu \in Y$ then $Y_\nu = \{\nu\}$ and $t_\nu = (\text{the truth value of } \nu \in Z)$,
(d) if $\nu \in B[\leq Y] \setminus Y$ then
   - (a) for every finite set $F \subseteq M \setminus M_{\leq \nu}$ there are infinitely many $\rho \in \text{Suc}_B(\nu)$ such that $(\forall \rho \in F)(\rho \parallel \rho \cap \rho \leq M \nu) \Rightarrow t_\rho = t_\nu$,
   - (b) $Y_\nu = \bigcup\{Y_\rho : \rho \in \text{Suc}_B(\nu)\}$ and $t_\rho = t_\nu$.

This is easily done and so $t_{\text{rt}_M}$ is well defined. For $\nu \in B[\leq Y]$ we let
\[ B'_\nu = \{\rho \in B_{\geq \nu} : \text{ for some } \rho \in Y_\nu \text{ we have } \rho \leq M \rho \leq M \mu \}. \]

Now define $Y$ by adding $B'_\nu$ to $\mathcal{A}_\nu^X$ for every $\nu \in B[\leq Y]$, and check.

2) First note that by Lemmas 3.3(1) and 3.4 we may assume that there is $B \in \mathcal{B}_X$ such that
   - $B$ is $\leq_X$-maximal,
   - $Y$ is a front of $B$, and
   - if $\nu \in B \setminus \text{max}(B)$ and $\rho \in M \setminus M_{\leq \nu}$, then for all but finitely many $\rho \in \text{Suc}_B(\nu)$ we have $\rho \parallel M \rho$.

Now note: if $h' : Y' \rightarrow A$, $Y' \in \text{frt}(B')$, $Z = \{\eta \in B' : \text{Suc}_B(\eta) \subseteq Y'\}$ is a front of $B'$ and $h'[\text{Suc}_B(\eta)]$ is one-to-one for all $\eta \in Z$, then we can find $B'' \in \text{psb}_M(B)$ such that $h'[B'' \cap Y']$ is one-to-one. So we may follow similarly as in part (1).

Let us recall the following definition.

**Definition 3.6.**

1. We say $D$ is a Q-point when $D$ is an ultrafilter on a countable set $\text{Dom}(D)$ such that if $f$ is a finite-to-one function with domain $\text{Dom}(D)$, then $f \restriction A$ is one-to-one for some $A \in D$.

2. A non-principal ultrafilter $D$ on a countable set $\text{Dom}(D)$ is a P-point if for each sequence $\langle A_n : n < \omega \rangle$ of sets from $D$ there is an $A \in D$ such that $A \setminus A_n$ is finite for each $n < \omega$.

We can conclude the main result of this section.

**Theorem 3.7.** Assume CH. There is a $x \in K$ such that:

(a) (a) $\mathcal{A}_n^X \neq \{\eta\}$ for $\eta \in M_X$. 

(b)
We choose Proof. In the end we let Definition 3.8. Note that clause (b)(ii) for each successor \( \alpha \) from our bookkeeping device) to take care of the bigness, if \( (b) \) for every \( A \subseteq M_\kappa \setminus \{ \text{rt}_\kappa \} \) is finite, there is a \( \leq_{\kappa} \)-maximal element in \( B_\kappa \).

We use a bookkeeping device to ensure largeness and bigness and

- for \( \alpha = 0 \) we use Lemma 3.1,
- for \( \alpha \) limit we use Definition 2.9(3) and Observation 2.10(2),
- if \( \alpha = \beta + 1 \), \( \beta \) is limit, then we use Lemma 3.5(1) (and the instructions from our bookkeeping device) to take care of the bigness,
- if \( \alpha = \beta + 2 \), \( \beta \) is limit, then we use Lemma 3.5(2) (and the instructions from our bookkeeping device) to take care of the largeness,
- if \( \alpha = \beta + 3 \), \( \beta \) is limit, then we use Lemma 3.3(3,4) (and the instructions from our bookkeeping device) to ensure that at the end \( \kappa \) is fat and full,
- if \( \alpha = \beta + k \), \( \beta \) is limit, \( 4 \leq k < \omega \), then we ensure clause (d).

In the end we let \( \kappa = \bigcup_{\alpha < \kappa_1} \kappa_\alpha \). Then \( \kappa \) is fat, big, large and \( B_\kappa \) is \( \kappa_1 \)-directed.

Note that clause (b)(\( \beta \)) follows from the largeness. \( \square \)

**Definition 3.8.** (1) We say that \( \kappa \in K \) is **nice** if it satisfies conditions (a)–(d) of Theorem 3.7. The class of all nice \( \kappa \) is denoted by \( K_\kappa \).

(2) An \( \kappa \in K \) is **reasonable** if it satisfies (a), (c) of Theorem 3.7. Let \( K_\kappa \) be the set of all \( \kappa \in K \) which are reasonable.

(3) Let \( K_\alpha \) be the set of \( \kappa \in K_\alpha \) for which clause (b)(\( \alpha \)) of Theorem 3.7 holds.

(4) For \( \kappa \in K \) we say that \( \mathcal{I} \) is \( \kappa \)-**dense**, when:

  (a) \( \mathcal{I} \subseteq \mathcal{A}_\kappa \) (see Definition 2.6(b)),
  (b) for every \( B_1 \in B_\kappa \) there is \( B_\nu \) such that
      \( B_1 \leq_{\kappa} B_\nu \in B_\kappa \), and
      \( B_1 \leq_{\kappa} B_\nu \in B_\kappa \), for some \( \nu \) we have
      \( \nu \in \text{sup}_{B_\nu}(\text{rt}_\kappa) \),  \( (B_\nu)_{\geq \nu} \in \mathcal{I} \), and \( (\forall \rho \in A)(\rho \parallel \nu) \).

(5) For \( \kappa \in K \) we say \( \mathcal{I} \) is \( \kappa \)-**open** if clause (a) from part (4) above and

  (c) if \( B_1 \in I \) then \( \text{sb}(B_1) \cap \mathcal{A}_\kappa \subseteq I \).

(6) Let \( K_{\mathcal{I}} \) be the class of \( \kappa \in K_\kappa \) which are **good**, which means: if \( \mathcal{I} \) is \( \kappa \)-dense, \( \kappa \)-open and \( B_1 \in B_\kappa \) then for some \( B_2 \in B_\kappa \) we have \( B_1 \leq_{\kappa} B_2 \) and \( (B_2)_{\geq \eta} \in \mathcal{I} \) for all but finitely many \( \eta \in \text{sup}_{B_\nu}(\text{rt}_\kappa) \).

(7) We say that \( \kappa \in K \) is **ultra** if it is both nice and good. Let \( K_{\mathcal{I}} \) be the class of \( \kappa \) which are ultra, i.e., \( K_{\mathcal{I}} = K_{\mathcal{I}} \cap K_\kappa \).

**Theorem 3.9.** Assume \( \Diamond_{\kappa_1} \). Then there exists an ultra \( \kappa \in K \).

\(^1\)Not a serious addition. As always, the number of \( \rho \in \text{sup}_{B_\nu}(\text{rt}_\kappa) \) failing this is finite.
Proof. We repeat the proof of Theorem 3.7 but at limit stages $\delta < \aleph_1$ we use additionally $\Diamond_{\aleph_1}$ to take care of the additional demand $x \in K_{\kappa}$ here. So we are given:

(A) $\delta < \aleph_1$ limit,
(B) $\mathcal{I}$ such that for some $y, \mathcal{I}$ we have
- $x_3 \leq_{\kappa} y \in K_{\aleph_1}$,
- $\mathcal{I} \subseteq A_y$ is dense open, and $\mathcal{I} = \mathcal{I} \cap \mathcal{A}_{\kappa}$,
- for some countable elementary submodel $N \prec H(\aleph_2)$, $(y, \mathcal{I}) \in N$

and $(x_3, \mathcal{I}) = (y|N, \mathcal{I} \cap N)$, so $M_{x_3} = M_y|N$, etc.

Let $(B^\ell_\lambda : \ell < \omega)$ be an increasing cofinal subset of $\langle \mathcal{B}_x, \leq_{\kappa} \rangle$. For every $\ell$ there is $B^\ell_1 \in \mathcal{B}_x$ such that $B^\ell_1 \subseteq x_3 B^\ell_1$, and for every finite $A \subseteq M_{x_3} \setminus \{\text{rt}(x_3)\}$ there is $\nu \in \text{suc}_{B^\ell_1}(\text{rt}(x_3))$ such that

$$(\forall \rho \in A)(\rho \parallel \nu) \quad \text{and} \quad (B^\ell_1 \supseteq \nu) \subseteq \mathcal{I}.$$ 

Clearly, for every $\ell$ for some $k(\ell) > \ell$ we have $B^k_{\delta, \ell} \subseteq x_3 B^0_{k(\ell)}$. We can choose $(l_n : n < \omega)$ so that $k(l_n) < l_{n+1}$. Let $B_n = B^i_{l_n}$. We continue as in Lemma 3.3(1) using the $(B_n : n < \omega)$ and, when choosing $\nu_n$, demanding additionally that $(B_n \supseteq \nu_n) \subseteq \mathcal{I}$.

Note that $(B_n \supseteq \nu_n) \subseteq \mathcal{I}$ implies $(B^*_{\nu_n}) \subseteq \mathcal{I}$ for $B^*_{\nu_n}$ as there.)

\begin{proposition}
Assume $x \in K_{\kappa}$.

(a) If $B \in \mathcal{B}_x$ and $Y_1, Y_2 \in \text{frt}(B)$ and $Y_2$ is above $Y_1$, then $h^x_{Y_2, Y_1}$ exemplifies $D^x_{\text{frt}, Y_1} \subseteq \text{RK} D^x_{\text{frt}, Y_2}$.

(b) $\{D^x_{\text{frt}} : Y \in \text{frt}_x\}$ is $\text{RK}$-directed (even $\aleph_1$ directed).

(c) $\text{If } Y \in \text{alm-frt}_x \text{ then } \leq_{\text{RK}, \text{below}} D^x_{\text{frt}} \text{ there is no } P \text{-point}.$

\end{proposition}

Proof. (a) Follows from Observation 2.8(6).

(b) By (a) and the directness of $\mathcal{B}_x$.

(c) Let $B_1 \in \mathcal{B}_x$ be such that $B_1 \cap Y$ is an almost front of $B_1$. Suppose that $h : Y \to N$ is such that $h^{-1}([n]) = \emptyset \mod D^x_{\text{frt}}$ for every $n$, hence there is $A_0 \in \mathcal{A}_x$ which witnesses this. Assume towards contradiction that $h(D^x_{\text{frt}})$ is a $P$-point; without loss of generality $h$ is onto $N$. As $\mathcal{B}_x$ is $\aleph_1$-directed we may pick $B_2 \in \mathcal{B}_x$ such that $A_0 \leq_{\kappa} B_2$ (for all $n < \omega$) and $B_1 \leq_{\kappa} B_2$.

As $x$ is large, we may apply the Definition 2.11 of large to the pair $(B_2, h')$ where $h'(\eta) = h(\nu)$ when $\nu \leq_{M_x} h(\eta)$ and zero if there is no such $\nu$. So there are $B_3, Y_3$ such that

(i) $B_3 \leq_{\kappa} B_3$.

(ii) $Y_3$ is a front of $B_3$ below $Y \cap B_3$.

(iii) for $\eta, \nu \in Y \cap B_3$ we have: $h(\eta) = h(\nu) \iff (\exists \rho \in Y_3)(\rho \leq_{M_x} \eta \land \rho \leq_{M_x} \nu)$.

Let $Z = \text{sup}_{B_3}(\text{rt}_x)$. If $Y_3 = \{\text{rt}_x\}$, then for some $n$ we have $h^{-1}([n]) \subseteq D^x_{\text{frt}}$, a contradiction. Therefore $Y_3 \neq \{\text{rt}_x\}$ and thus $\text{rt}_x \notin Y_3$, so $Y_3$ is above $Z$. Clearly, $D^x_{\text{frt}} \subseteq \text{RK} h(D^x_{\text{frt}})$ and hence $D^x_{\text{frt}}$ is a $P$-point.

By clauses (c) and (d) of Theorem 3.7 there is $B_4 \in \mathcal{B}_x$ such that $B_3 \leq_{\kappa} B_4$, $B_4 \cap Z$ is a front of $B_4$ and

$$(\forall \theta \in \text{sup}_{B_4}(\text{rt}_x))(\exists \infty \rho \in \text{sup}_{B_4}(\text{rt}_x))(\rho \leq_{M_x} \theta).$$

For each $\rho \in \text{sup}_{B_4}(\text{rt}_x)$ let $Z_\rho = \{\theta \in Z : \rho \leq_{M_x} \theta\}$, so $(Z_\rho : \rho \in \text{sup}_{B_4}(\text{rt}_x))$ is a partition of $Z$, and $Z_\rho = 0 \mod D^x_{\text{frt}}$ for each $\rho$. But clearly there is no $Z^* \subseteq D^x_{\text{frt}}$
such that $Z' \cap Z_0$ is finite for every $g \in \text{suc}_{B_4}(rt_4)$, contradiction to “$D^*_Z$ is a $P$-point”. \hfill \Box

4. Basic connections to forcing

Definition 4.1. \hspace{1em} (1) For a forcing notion $Q$ and $p \in Q$ we define $\varnothing_{ab} = \varnothing_p^{sb} = \varnothing_p^{sb},$ the strong bounding game between the null player NU and the bounding player BND as follows.

(a) A play last $\omega$ moves, and
(b) in the $n$-th move:
   (α) first the NU player gives a (non-empty) tree $T_n$ with $\omega$ levels and no maximal node and a $Q$-name $F_n$ of a function with domain $\mathcal{T}_n$ such that
   $$\eta \in \mathcal{T}_n \Rightarrow p \Vdash \eta \in \text{suc}_{\mathcal{T}_n}(\eta),$$
   (β) then BND player chooses $\eta_n \in \mathcal{T}_n.$
   (c) In the end, the BND player wins the play $\langle \mathcal{T}_n, \eta_n : n < \omega \rangle$ if and only if there is $q \in Q$ above $p$ forcing that
   $$\left( \forall n < \omega \right) \left( \exists k < \text{level}(\eta_n) \right) \left( F_n(\eta_n, k) \leq \mathcal{T}_n \eta_n \land k \text{ is even} \right),$$
   where $\eta_n[k]$ is the unique $\nu \leq \mathcal{T}_n \eta_n$ of level $k.$

(2) Omitting $p$ means NU chooses it in his first move.

(3) A forcing notion $Q$ is strongly bounding if for every condition $p \in Q$ player BND has a winning strategy in the game $\varnothing_p^{sb}.$

Definition 4.2. \hspace{1em} (1) We say $\mathcal{P} \subseteq [\aleph_0]^{<\omega}$ is big when for every $c : \mathbb{N} \rightarrow \{0, 1\}$ there is $A \in \mathcal{P}$ such that $c \upharpoonright A$ is constant.

(2) For $B \in \text{CWT}(\omega^2, \omega, \prec)$ we say that a family $\mathcal{B} \subseteq \text{psb}(B)$ is big (in $B$) when for every $c : \text{max}(B) \rightarrow \{0, 1\}$ there is $B' \in \mathcal{B}$ such that $c \upharpoonright \text{max}(B')$ is constant.

(3) For $B \in \text{CWT}(\omega^2, \omega, \prec)$ we say that a family $\mathcal{B} \subseteq \text{psb}(B)$ is large (in $B$) when for every function $c$ with domain $\text{max}(B)$ there is $B' \in \mathcal{B}$ and front $Y$ of $B'$ such that for every $\eta, \nu \in \text{max}(B')$ we have $c(\eta) = c(\nu) \iff \left( \exists \rho \in Y \right) \left( \rho \leq_B \nu \land \rho \leq B \eta \right)$.

Theorem 4.3. Assume that:

(a) $B \in \text{CWT}(M)$ for a partial order $M = (\omega^2, \omega, \prec),$

(b) $Q$ is a strongly bounding forcing notion,

(c) (α) $\text{forcing with } Q \text{ preserves some non-principal ultrafilter on } \aleph_0,$ or just \hspace{1em} (β) $([\aleph_0]^{<\omega})^Q$ is big in $\text{V}^Q,$ see Definition 4.2,

(d) $p \Vdash “ \mathcal{A} \subseteq \text{max}(B)”.$

Then there are $B' \in \text{psb}(B)$ and $q \in Q$ such that $p \leq q$ and

$$q \Vdash “ \text{max}(B') \subseteq \tau ” \text{ or } q \Vdash “ \text{max}(B') \subseteq \text{max}(B) \setminus \tau “.$$

Proof. We prove this by induction on $\text{Dp}(B)$ (see Definition 2.2), for all such $B$'s. Let $\eta = \text{rt}(B)$.

Case 1: $\text{Dp}(B) = 0$

Trivial, as then $B = \{\eta\},$ i.e., $B$ is a singleton so $B' = B$ can serve.

Case 2: $\text{Dp}_x(B) = 1$
Then $D_p(B_{2^\nu}) = 0$ for all $\nu \in B\setminus \{\eta\}$. Now, $|B\setminus \{\eta\}| = \aleph_0$ and we just need to find $p' \in \mathbb{Q}$ above $p$ such that $\{\nu \in B : \nu \neq \eta$ and $p'$ forces $\nu \in A$ or forces $\nu \notin A\}$ is infinite. As $\Vdash_\mathbb{Q} [([\mathbb{N}]^{\aleph_0})^\mathbb{V}]$ is big in $\mathbb{V}^\mathbb{Q}$” (see clause (c) of our assumptions) this is possible.

**Case 3:** $\alpha = D_p(B) > 1$

Let $Y = \text{succ}_p(\eta)$. Then for $\nu \in Y$ we have $D_p(B_{2^\nu}) < \alpha$, hence the induction hypothesis applies to $B_{2^\nu}$. We may assume that if $\rho$ is not below $\eta$ then for all but finitely many $\nu \in Y$ we have $\nu \parallel \rho$ (cf. the proof of Lemma 3.4). Let $\langle \nu_n : \nu \in \mathbb{N} \rangle$ list $Y$.

We simulate a play of $\mathcal{O}_{\mathbb{Q},p}^b$, in which the BND player uses a winning strategy and the NU player acts so that in the $n$-th move:

\[ (* )_1 \quad (a) \quad \mathcal{F}_n = \{ \langle B_{\ell_0}, \ldots , B_{k-1} \rangle : k \in \mathbb{N} , B_{\ell} \in \text{psb}(B_{2^{\nu_n}}) \text{ for } \ell < k \text{ and } B_{\ell+1} \subseteq B_{\ell} \text{ if } \ell + 1 < k \} , \]

\[ (b) \quad \text{is an initial segment}, \]

\[ (c) \quad F_n((B_{0}, \ldots , B_{k-1})) \text{ is } (B_{0}, \ldots , B_{k-1}, B') \text{ for some } B' \in \text{psb}(B_{2^{\nu_n}}) \cap \mathbb{V} \text{ such that} \]

either $\max(B') \subseteq A$ or $\max(B') \cap A = \emptyset$.

There is such a function $F_n$ because of the induction hypothesis.

Clearly we can do this. As the player BND has used a winning strategy, BND has won the play so there is $q \in \mathbb{Q}$ stronger than $p$ and such that

\[ (* )_2 \quad q \Vdash \text{“for every } n \text{ for some even } k < \text{ levels } \mathcal{F}_n(\eta_n) \text{ we have } F_n(\eta_n|k) \leq \mathcal{F}_n(\eta_n”}. \]

Hence by the choice of $\langle \mathcal{F}_n, F_n \rangle$, letting $\eta_n = \langle B_{n,0}, \ldots , B_{n,k(n)} \rangle$ we have

\[ (* )_3 \quad \text{for some } \langle \mathfrak{t}_n : n \in \mathbb{N} \rangle \]

\[ (a) \quad B_{n,k(n)} \in \text{psb}(B_{2^{\nu_n}}), \]

\[ (b) \quad \mathfrak{t}_n \text{ is a } \mathbb{Q}\text{-name of the truth value}, \]

\[ (c) \quad q \Vdash \text{“if } \mathfrak{t}_n = 1 \text{ then } \max(B_{n,k(n)}) \subseteq A, \text{ and if } \mathfrak{t}_n = 0 \text{ then } \max(B_{n,k(n)}) \cap A = \emptyset”}. \]

Now by clause (c) of our assumptions

\[ (* )_4 \quad \text{there is an infinite } W \subseteq \mathbb{N}, \text{ a truth value } t \text{ and a condition } r \text{ such that} \]

$q \leq_r r \text{ and } r \Vdash \text{“}\mathfrak{t}_n = t \text{ for } n \in W”}. \]

Lastly, let $B_* = \bigcup \{ B_{n,k(n)} : n \in W \} \cup \{ \eta \}$ and clearly $B_*, r$ are as required. \qed

**Remark 4.4.** In the assumption (b) of Theorem 4.3 it is enough that the BND player does not lose the game $\mathcal{O}_{\mathbb{Q}}^b$, i.e., the NU player has no winning strategy.

**Theorem 4.5.** Assume that

\[ (a) \quad \mathbb{Q} \text{ is an } \omega^- \text{-bounding proper forcing notion}, \]

\[ (b) \quad \text{forcing with } \mathbb{Q} \text{ preserves some } P\text{-point}, \text{ and} \]

\[ (c) \quad B \in \text{CWT}(\omega^+, \omega). \]

Then $(\text{psb}(B))^\mathbb{V}$ is big in $\mathbb{V}^\mathbb{Q}$; see Definition 4.2(2).

**Proof.** Let $D$ be a $P$-point ultrafilter such that $\Vdash_\mathbb{Q} “ D \text{ generates an ultrafilter ”}$ and $p \in \mathbb{Q}$. Suppose that $p \Vdash “ \mathcal{F} \text{: max}(B) \rightarrow \{0,1\} ”$. Let $\mathcal{G}$ be a large enough regular cardinal and $N \prec (\mathcal{M}(\chi), \in)$ be a countable model with $B, \mathbb{Q}, p, \mathcal{G}, \ldots \in N$. Let $q \in \mathbb{Q}$ be such that

\[ (a) \quad p \leq_q q, \]

\[ (b) \quad q \text{ is } (N, \mathbb{Q})\text{-generic}, \]
From \((g, A)\) we can compute \(c\) and \(B' \in (\text{psb}(B))^V\) such that \(q \Vdash ^* B'\) is constantly \(c\), so we are done.  

\[ \boxed{\text{Theorem 4.6. Assume that } x \in K \text{ and} \]

\begin{enumerate}
\item \(Q\) is a proper forcing notion,
\item \(D_x\) is a Ramsey ultrafilter in \(V\),
\item \[\begin{cases}
\text{if } Dp(B) = 0, \text{ i.e., } |B| = 1 \text{ this is trivial.} \\
\text{if } Dp(B) = 1 \text{ let } \{\eta_n : n \in \mathbb{N}\} \in V \text{ list } \text{succ}(rt_x); \text{ by assumption (C) in } V^Q, \text{ for some } A \in \text{fil}(D_x) \text{ the sequence } (c(\eta_n) : n \in A) \text{ is constant or without repetitions. Without loss of generality } A \in D_x \subseteq V \text{ and then } \{rt_x\} \cup \{\eta_n : n \in A\} \text{ is as required.} 
\end{cases} \]
\item Assume \(Dp(B) > 1\). Without loss of generality \(0 \notin \text{Rang}(c)\). For \(v \in B\), \(\text{max}(B)\) let \(\{\eta_{v, n} : n \in \mathbb{N}\}\) list \(\text{succ}(v)\) so that the function \((v, n) \mapsto \eta_{v, n}\) belongs to \(V\). In \(V^Q\), by downward induction on \(v \in B\), we choose \(k_v = k(v), A_v, A_{v, \rho}\) and \(t_{v, \rho}\) so that the following requirements (a)-(d) are satisfied:
\begin{enumerate}
\item \(k_v \in \mathbb{N}, A_v \in D_x,\)
\item if \(v \in \text{max}(B)\), then \(k_v = c(v), \text{ so } > 0,\)
\item if \(v \notin \text{max}(B)\) then \((\alpha)_v\) or \((\beta)_v\) where:
\begin{align*}
(\alpha)_v & : k_v = 0 \text{ and } (k(\eta_{v, n}) : n \in A_v) \text{ is with no repetitions, all non-zero,} \\
(\beta)_v & : (k(\eta_{v, n}) : n \in A_v) \text{ is constantly } k_v,
\end{align*}
\item for \(v, \rho \in B\), \(\text{max}(B)\) we have \(A_{v, \rho} \in D_x\) and \(t_{v, \rho} \in \{0, 1\}\) and
\begin{enumerate}
\item either \(t_{v, \rho} = 1\) and \(n \in A_{v, \rho} \Rightarrow k(\eta_{v, n}) = k(\eta_{v, n})\) or \(t_{v, \rho} = 0\) and \(\{k(\eta_{v, n}) : n \in A_v\} \text{ is disjoint to } \{k(\eta_{v, n}) : n \in A_{v, \rho}\}.\)
\end{enumerate}
\end{enumerate}
\end{enumerate}
\] This is possible by assumption (C). By the same assumption, there is \(A_x \in D_x\) such that
\begin{enumerate}
\item \(1\) \(v \in B \setminus \text{max}(B)\) then \(A_x \subseteq^* A_v,\)
\item \(2\) \(v, \rho \in B \setminus \text{max}(B)\) then \(A_x \subseteq^* A_{v, \rho}.\)
\end{enumerate}

Let \(\{\eta_{v, n} : n \in \mathbb{N}\}\) list \(B \setminus \text{max}(B)\) and let \(f_1\) be the function with domain \(B \setminus \text{max}(B)\) such that
\[ f_1(v) = \{\eta_{v, n} : n \in A_x \setminus A_v \text{ or for some } k < \ell \text{ we have } v = v_\ell \land n \in A_x \setminus A_{v_k, v_\ell} \} \]
so \(f_1(v) \in [\text{succ}_B(v)]^{<\mathbb{N}}\).

As the forcing \(Q\) satisfies (C), it is bounding, so there is a function \(f_2 \in V\) with domain \(B \setminus \text{max}(B)\) such that \(f_1(v) \subseteq f_2(v) \in [\text{succ}_B(v)]^{<\mathbb{N}}\). Clearly
\begin{enumerate}
\item \(B_1 = A_B f = \{v \in B : v \notin B \text{ satisfies } r_{t_x} \leq_B \rho < B v \text{ and } n \text{ is such that } \eta_{v, n} \leq_B v \text{ then } n \in A_x \text{ but } \eta_{v, n} \notin f_2(v) \} \in \text{psb}(B)^V.\)
\end{enumerate}

Define
\begin{enumerate}
\item \(Y = \{v \in B_1 : k_v \neq 0 \text{ and } \rho < B v \Rightarrow k_\rho = 0\}.\)
\end{enumerate}

Plainly,
\begin{enumerate}
\item \(Y\) is a front of \(B_1\), and
\end{enumerate}
(b) if $\nu \in Y$ then $c(B_1)_{>\nu}$ is constantly $k_\nu$.

Note that

\((*)_5\) if $\nu \in B_1$ and $k_\nu = 0$, then either $k_\eta = 0$ for all $\eta \in \text{suc} B_1(\nu)$, or $k_\eta > 0$ for all $\eta \in \text{suc} B_1(\nu)$.

Hence

\((*)_6\) if $\nu \in B_1 \setminus \max(B_1)$ and $\text{suc} B_1(\nu)$ is not disjoint to $Y$, then $\text{suc} B_1(\nu) \subseteq Y$.

If $Y = \{rt_x\}$ we are done, so assume not. Let $Z = \{\eta \in B_1 : \eta \notin \max(B_1) \text{ and } \text{suc} B_1(\eta) \subseteq Y\}$. So

\((*)_8\) (a) both $Z$ and $Y$ are fronts of $B_1$,
(b) both $Z$ and $Y$ belong to $\mathbf{V}$,
(c) if $\nu \in Y$ then $(k_\rho : \rho \in \max((B_1)_{>\nu}))$ is constantly $k_\nu$.

Also if $Z = \{rt_x\}$ we are done so assume not and let $(\nu_n : n \in \mathbb{N})$ list $Z$. As $\text{fil}(D_*)$ is a Ramsey ultrafilter we can find $\tilde{n}$ such that

\((*)_9\) (a) $\tilde{n} = (n(i) : i \in \mathbb{N})$ is an increasing enumeration of a member of $D_*$, hence $\tilde{n} \in \mathbf{V}$,
(b) if $\ell \leq i$ then $k_\nu(n(i)) \in B_1$,
(c) if $\ell < i$, $t_{\nu,\nu_i} = 0$ and $\nu_\ell, \nu_i \in B_1[\leq Z]$, then \(\{k(\eta_\nu(n(j)) : i \leq j)\}
\) is disjoint from $\{k(n_\nu(n(j)) : i \leq j)\}$, moreover it is disjoint from $\{1(\eta_\nu(n(j)) : j \in \mathbb{N})\}$.

Lastly, as $\tilde{n} \in \mathbf{V}$ we can find in $\mathbf{V}$ a partition $(C_\ell : \ell \in \mathbb{N})$ of $\mathbb{N}$ to (pairwise disjoint) infinite sets and let

$$B_2 = \{\varrho \in B_1 : \text{ if } \nu_\ell < B_1 \varrho \text{ and } \nu_\ell \in B_1[\leq Z],$$
then for some $i \in C_\ell$ we have $i > \ell$ and $n_\nu(n(i)) \leq B_2 \varrho\}.$

Easily $B_2 \in \mathbf{V}$, $B_2 \in \text{psb}(B_1)$ and it is as required.

Motivated by Definition 4.1 we introduce the following bounding games for a forcing notion $\mathbb{Q}$.

**Definition 4.7**. Let $\mathbb{Q}$ be a forcing notion and $p \in \mathbb{Q}$

1. We define a game $\mathcal{G}_{\text{bd}} = \mathcal{G}_{\text{bd}}^p = \mathcal{G}_{\mathbb{Q},p}^\text{bd}$ by
   (a) a play last $\omega$-moves,
   (b) in the $n$-th move
     \((\alpha)\) first the NU player gives a $\mathbb{Q}$-name $\tau_n$ of a member of $\mathbf{V}$ and then
     \((\beta)\) the BND player gives a finite set $w_n \subseteq \mathbf{V}$.
   (c) In the end of the play the BND player wins the play if there is $q \in \mathbb{Q}$ above $p$ forcing $\tau_n \in w_n$ for every $n$.

Omitting $p$ means that the player NU chooses it in his first move.

2. A game $\mathcal{G}_{\text{ufbd}} = \mathcal{G}_{\text{ufbd}}^p = \mathcal{G}_{\mathbb{Q},p}^\text{ufbd}$ is defined as follows.
   (a) A play last $\omega$-moves, and
   (b) in the $n$-th move
     \((\alpha)\) first the NU player chooses an ultrafilter $E_n$ on some set $I_n$ from $\mathbf{V}$ and a $\mathbb{Q}$-name $X_n$ of a member of $E_n^+$ of an ultrafilter on $I_n$ extending $E_n$ and a $\mathbb{Q}$-name $X_n$ of a member of $E_n^+$
     \((\beta)\) the BND player chooses $t_n \in I_n$.
   (c) In the end of the play the BND player wins the play if there is $q \in \mathbb{Q}$ above $p$ forcing $t_n \in X_n$ for every $n$. 

\(16\) SAHARON SHELAH
Omitting $p$ means that the player NU chooses it in his first move.

(3) A game $\mathcal{O}_{\text{vbd}} = \mathcal{O}_p^\text{vbd} = \mathcal{O}_{Q,p}^\text{vbd}$ is defined like $\mathcal{O}_{\text{vbd}}^p$ in (2) but now

$$\models Q \; X_n \in E_n$$ or just includes a member of $E_n$,

so $E_n$ is redundant.

Basic relations between the games introduced above are given by the following result.

**Proposition 4.8.** Let $Q$ be a forcing notion.

1. If BND wins in $\mathcal{O}_{Q,p}^{\text{ab}}$ then BND wins in $\mathcal{O}_{Q,p}^\text{bd}$ which implies that $Q$ is a bounding forcing.
2. The player BND wins in $\mathcal{O}_{Q,p}^\text{bd}$ iff BND wins in $\mathcal{O}_{Q,p}^{\text{vbd}}$.
3. If the player BND wins in $\mathcal{O}_{Q,p}^{\text{vbd}}$ then BND wins in $\mathcal{O}_{Q,p}^\text{bd}$.
4. We can replace in (1)–(3) above “wins” by “do not lose”.

**Proof.** 1) The second implication is obvious, so we concentrate on the first. For every $\tau$, a $Q$-name of an ordinal we define a pair $(T_\tau, F_\tau)$ as follows:

\[ (*)_1 \]
(a) let $u = \{\alpha : \dot{\tau}_{\alpha} \neq \alpha\}$, it is a non-empty set of $\leq |Q|$ ordinals,
(b) $T_\tau$ is the tree $\{\eta : \eta \in \dot{\tau} \upharpoonright u\}$, i.e., ordered by $\dot{\triangleleft}$ (being an initial segment),
(c) $F_\tau(\eta) = \eta^{\dot{\tau}}(\tau)$ for $\eta \in T_\tau$.

Clearly,

\[ (*)_2 \]
(a) $T_\tau$ is in $V$, a tree with $\omega$ levels,
(b) $F_\tau$ is a $Q$-name of a function with domain $T_\tau$ such that $\models Q \; F_\tau(\eta) \in \text{suc}_T(\eta)$.
(c) if $q \in Q$ and $\eta \in T_\tau$ (so $\text{Rang}(\eta)$ is a finite subset of $u$) then the following are equivalent:
\( (i) \) $q \models \dot{\tau} \in \text{Rang}(\eta)$,
\( (ii) \) $q \models \dot{\nu}^{\dot{\tau}}(\nu) \subseteq \eta$.

So playing the game $\mathcal{O}_{Q,p}^\text{bd}$ we can “translate” it to a play of $\mathcal{O}_{Q,p}^{\text{vbd}}$, replacing the NU choice of $\tau_n$ by the choice of $(T_\tau, F_\tau)$. Thus every strategy $\text{st}_1$ of BND in $\mathcal{O}_{Q,p}^{\text{ab}}$ translates it to a strategy $\text{st}_2$ of the player BND in $\mathcal{O}_{Q,p}^\text{bd}$.

2) We now need two translations.

Translating $\mathcal{O}_{Q,p}^{\text{vbd}}$ to $\mathcal{O}_{Q,p}^\text{bd}$.

So we are given a move $y = (I, E, X)$ of NU in a play of $\mathcal{O}_{Q,p}^{\text{vbd}}$ as in Definition 4.7(3), i.e.,

- $I \in V$, $E$ is an ultrafilter on $I$, in $V$, and
- $\models Q \; X \in E$ or just includes a member $X'$ of $E$.

Now,

\[ (*) \]
if $q \models \dot{X}' \subseteq \dot{W}$ where $\dot{W} \subseteq E$ is finite ($\dot{W}$ an object in $V$ not a name), then

$$\bigcap\{A : A \in \dot{W}\}$$ is non-empty and $t \in \bigcap\{A : A \in \dot{W}\} \Rightarrow q \models \dot{t} \in \dot{X}' \subseteq \dot{X}$.

Translating $\mathcal{O}_{Q,p}^\text{bd}$ to $\mathcal{O}_{Q,p}^{\text{vbd}}$.

Given $y = (i, \tau), V$ a $Q$-name of a member $I$ of $V$ we define $I_y = [I]^{<\aleph_0} \in V$
and choose $E_y \in V$ an ultrafilter on $I_y$ such that $u_\ast \in [I]^{<\aleph_0} \Rightarrow \{u \in [I]^{<\aleph_0} : u_\ast \subseteq$
$u \in E$; lastly we choose
$$X_y = \{ u \in [I]^{<\aleph_0} : \tau \in u \}.$$So $(I_y, E_y, X_y)$ is a legal move in $\mathcal{C}^{\text{fin}}_{\aleph_0}$ and for a finite subset $t$ of $I$:
$$(* *) \text{ if } q \models "t \in X_y", \text{ then } q \models "\tau \in t".$$
3) Obvious.
4) The same proof. □

Acknowledgement: We thank Alan Dow for asking me about $B_2(B),(C)$ and for some comments and Andrzej Roslanowski for much help. We also thank Alice Leonhardt for the beautiful typing.

The author thanks the National Science Foundation, Grant 0600940 and the US-Israel Binational Science Foundation, Grant 2010405 for partial support of this work.
