# TORSION-FREE ABELIAN GROUPS ARE BOREL COMPLETE 

GIANLUCA PAOLINI AND SAHARON SHELAH

#### Abstract

We prove that the Borel space of torsion-free Abelian groups with domain $\omega$ is Borel complete, i.e., the isomorphism relation on this Borel space is as complicated as possible, as an isomorphism relation. This solves a longstanding open problem in descriptive set theory, which dates back to the seminal paper on Borel reducibility of Friedman and Stanley from 1989.

## 1. Introduction

Since the seminal paper of Friedman and Stanley on Borel complexity [4, descriptive set theory has proved itself to be a decisive tool in the analysis of complexity problems for classes of countable structures. A canonical example of this phenomenon is the famous result of Thomas from 18 which shows that the complexity of the isomorphism relation for torsion-free abelian groups of rank $1 \leqslant n<\omega$ (denoted as $\cong_{n}$ ) is strictly increasing with $n$, thus, on one hand, finally providing a satisfactory reason for the difficulties found by many eminent mathematicians in finding systems of invariants for torsion-free abelian groups of rank $2 \leqslant n<\omega$ which were as simple as the one provided by Baer for $n=1$ (see [2]), and, on the other hand, showing that for no $1 \leqslant n<\omega$ the relation $\cong_{n}$ is universal among countable Borel equivalence relations. As a matter of facts, abelian group theory has been one of the most important fields of mathematics from which taking inspiration for forging the general theory of Borel complexity as well as for finding some of the most striking applications thereof. The present paper continues this tradition solving one of the most important problems in the area, a problem open since the above mentioned paper of Friedman and Stanley from 1989. In technical terms, we prove that the space of countable torsion-free abelian groups with domain $\omega$ is Borel complete.

As we will see in detail below, saying that a class of countable structures is Borel complete means that the isomorphism relation on this class is as complicated as possible, as an isomorphism relation. The Borel completeness of countable abelian group theory is particularly interesting from the perspective of model theory, as this class is model theoretically "low", i.e., stable (in the terminology of [15]). In fact, as already observed in [4], Borel reducibility can be thought of as a weak version of $\mathfrak{L}_{\omega_{1}, \omega}$-interpretability, and for other classes of countable structures such as groups or fields much stronger results than Borel completeness exist, as in such cases we can first-order interpret graph theory, but such classes are unstable, while abelian group

[^0]GIANLUCA PAOLINI AND SAHARON SHELAH
theory is stable. Reference [8] starts a systematic study of the relations between Borel reducibility and classification theory in the context of $\aleph_{0}$-stable theories.

Coming back to us, we now introduce the notions from descriptive set theory which are necessary to understand our results, and we try to make a complete historical account of the problems which we tackle in this paper. The starting point of the descriptive set theory of countable structures is the following fact:
Fact 1.1. The set $\mathrm{K}_{\omega}^{L}$ of structures with domain $\omega$ in a given countable language $L$ is endowed with a standard Borel space structure $\left(\mathrm{K}_{\omega}^{L}, \mathcal{B}\right)$. Every Borel subset of this space $\left(\mathrm{K}_{\omega}^{L}, \mathcal{B}\right)$ is naturally endowed with the Borel structure induced by $\left(\mathrm{K}_{\omega}^{L}, \mathcal{B}\right)$.

For example, if take $L=\left\{e, \cdot,()^{-1}\right\}$, and we let $K^{\prime}$ to be one of the following:
(a) the set of elements of $K_{\omega}^{L}$ which are groups;
(b) the set of elements of $K_{\omega}^{L}$ which are abelian groups;
(c) the set of elements of $\mathrm{K}_{\omega}^{L}$ which are torsion-free abelian groups;
(d) the set of elements of $\mathrm{K}_{\omega}^{L}$ which are $n$-nilpotent groups, for some $n<\omega$;
then we have that $K^{\prime}$ is a Borel subset of $\left(K_{\omega}^{L}, \mathcal{B}\right)$, and so Fact 1.1 applies.
Thus, given a class $K^{\prime}$ as in Fact 1.1, we can consider $K^{\prime}$ as a standard Borel space, and so we can analyze the complexity of certain subsets of this space or of certain relations on it (i.e., subsets of $K^{\prime} \times K^{\prime}$ with the product Borel space structure). Further, this technology allows us to compare pairs of classes of structures or, in another direction, pairs of relations defined on pairs of classes of structures.

Definition 1.2. Let $X_{1}$ and $X_{2}$ be two standard Borel spaces, and let also $Y_{1} \subseteq X_{1}$ and $Y_{2} \subseteq X_{2}$. We say that $Y_{1}$ is reducible to $Y_{2}$, denoted as $Y_{1} \leqslant_{R} Y_{2}$, when there is a Borel map B: $X_{1} \rightarrow X_{2}$ such that for every $x \in X_{1}$ we have:

$$
x \in Y_{1} \Leftrightarrow \mathbf{B}(x) \in Y_{2} .
$$

Notice that Definition 1.2 covers in particular the case $X_{1}=K^{\prime} \times K^{\prime}$ for $K^{\prime}$ as in Fact 1.1, and so for example $Y_{1}$ could be the isomorphism relation on $K^{\prime}$. Also, given a Borel space $X$, we can ask if there are subsets of $X$ which are $\leqslant_{R}$-maxima with respect to a fixed family of subsets of an arbitrary Borel space (e.g., Borel sets, analytic sets, co-analytic sets, etc). In particular we can define:

Definition 1.3. Let $X_{1}$ be a Borel space and $Y_{1} \subseteq X_{1}$. We say that $Y_{1}$ is complete analytic (resp. complete co-analytic) if for every Borel space $X_{2}$ and analytic subset (resp. co-analytic subset) $Y_{2}$ of $X_{2}$ we have that $Y_{2} \leqslant_{R} Y_{1}$.

We now introduce the notion of Borel reducibility among equivalence relations.
Definition 1.4. Let $X_{1}$ and $X_{2}$ be two standard Borel spaces, and let also $E_{1}$ be an equivalence relation defined on $X_{1}$ and $E_{2}$ be an equivalence relation defined on $X_{2}$. We say that $E_{1}$ is Borel reducible to $E_{2}$, denoted as $E_{1} \leqslant_{B} E_{2}$, when there is a Borel map B : $X_{1} \rightarrow X_{2}$ such that for every $x, y \in X_{1}$ we have:

$$
x E_{1} y \Leftrightarrow \mathbf{B}(x) E_{2} \mathbf{B}(y) .
$$

Remark 1.5. Notice that in the context of Definitions 1.2 and 1.4. $E_{1} \leqslant_{R} E_{2}$ and $E_{1} \leqslant_{B} E_{2}$ have two different meaning, as in the first case the witnessing Borel function has domain $X \times X$, while in the second case it has domain $X$. Furthermore, notice that $E_{1} \leqslant_{B} E_{2}$ implies $E_{1} \leqslant_{R} E_{2}$ (but the converse need not hold, see 1.7).

We now define Borel completeness, the notion at the heart of our paper.

Definition 1.6. Let $\mathrm{K}_{1}$ be a Borel class of structures with domain $\omega$ and let $\cong_{1}$ be the isomorphism relation on $\mathrm{K}_{1}$. We say that $\mathrm{K}_{1}$ is Borel complete (or, in more modern terminology, $\cong_{1}$ is $\mathrm{S}_{\infty}$-complete) if for every Borel class $\mathrm{K}_{2}$ of structures with domain $\omega$ there is a Borel map $\mathbf{B}: \mathrm{K}_{2} \rightarrow \mathrm{~K}_{1}$ such that for every $A, B \in \mathrm{~K}_{2}$ :

$$
A \cong B \Leftrightarrow \mathbf{B}(A) \cong_{1} \mathbf{B}(B)
$$

that is, the isomorphism relation on the space $\mathrm{K}_{2}$ is Borel reducible (in the sense of Definition 1.4) to the the isomorphism relation on the space $\mathrm{K}_{1}$.

The following fact will be relevant for our subsequent historical account.
Fact 1.7 ([4]). Let K be a Borel class of structures with domain $\omega$. If K is Borel complete, then its isomorphism relation is a complete analytic subset of $\mathrm{K} \times \mathrm{K}$, but the converse need not hold, as for example abelian p-groups with domain $\omega$ have complete analytic isomorphism relation but they are not a Borel complete space.

We now have all the ingredients necessary to be able to understand the problems that we solve in this paper and to introduce the state of the art concerning them. But first a useful piece of notation which we will use throughout the paper.

Notation 1.8. (1) We denote by Graph the class of graphs.
(2) We denote by Gp the class of groups.
(3) We denote by AB the class of abelian groups.
(4) We denote by TFAB the class of torsion-free abelian groups.
(5) Given a class K we denote by $\mathrm{K}_{\omega}$ the set of structures in K with domain $\omega$.

Convention 1.9. To simplify statements, we use the following convention: when we say that a class K of countable structures is Borel complete we mean that $\mathrm{K}_{\omega}$ is Borel complete. Similarly, when we say that a class K of countable groups is complete co-analytic we mean that $\mathrm{K}_{\omega}$ is a complete co-analytic subset of $\mathrm{Gp}_{\omega}$. Finally, when we say that the isomorphism relation on a class of countable groups is analytic, we mean that restriction of the isomorphism relation on K to $\mathrm{K}_{\omega} \times \mathrm{K}_{\omega}$ is an analytic subset of the Borel space $\mathrm{Gp}_{\omega} \times \mathrm{Gp}_{\omega}$ (as a product space).

In [4], together with the general notions just defined, the authors studied some Borel complexity problems for specific classes of countable structures of interest. Among other things they showed (we mention only the results relevant to us):
(i) countable graphs, linear orders and trees are Borel complete;
(ii) torsion abelian groups have complete analytic $\cong$ but are not Borel complete;
(iii) nilpotent groups of class 2 and exponent $p$ ( $p$ a prime) are Borel complet $\ell^{1}$
(iv) the isomorphism relation on finite rank torsion-free abelian groups is Borel.

In 44 Friedman and Stanley state explicitly:
There is, alas, a missing piece to the puzzle, namely our conjecture that torsion-free abelian groups are complete. [...] We have not even been able to show that the isomorphism relation on torsionfree abelian groups is complete analytic, nor, in another direction, that the class of all abelian groups is Borel complete. We consider these problems to be among the most important in the subject.

[^1]The challenge was taken by several mathematicians. The first to work on this problem was Hjorth, which in [6] proved that any Borel isomorphism relation is Borel reducible (in the sense of Definition 1.4) to the isomorphism relation on countable torsion-free abelian groups, and that in particular the isomorphism relation on $\mathrm{TFAB}_{\omega}$ is not Borel (as there is no such Borel equivalence relation), leaving though open the question whether $\mathrm{TFAB}_{\omega}$ is a Borel complete class, or even whether the isomorphism relation on $\mathrm{TFAB}_{\omega}$ is complete analytic (cf. Def. 1.3 and Fact 1.7).

The problem resisted further attempts of the time and the interest moved to another very interesting problem on torsion-free abelian groups: for $1 \leqslant n<m<\omega$, is the isomorphism relation $\cong_{n}$ on torsion-free abelian groups of rank $n$ strictly less complex (in the sense of Definition 1.4) than the isomorphism relation on torsionfree abelian groups of rank $m$ ? As mentioned above, the isomorphism relation on torsion-free abelian groups of finite rank is Borel while, as just mentioned, the isomorphim relation on countable torsion-free abelian groups is not, and so the two problems are quite different, but obviously related. Also this problem proved to be very challenging, until Thomas finally gave a positive solution to the problem, in a series of two fundamental papers [17, 18, proving in particular that, for every $n<\omega, \cong_{n}$ is not universal among countable Borel equivalence relations.

The fundamental work of Thomas thus resolved completely the case of torsionfree abelian groups of finite rank, leaving open the problem for countable torsion-free abelian groups of arbitrary rank, i.e. the problem referred to as "among the most important in the subject" in 4]. The problem remained "dormant" for various years (at the best of our knowledge), until Downey and Montalbán [3 made some important progress showing that the isomorphism relation on countable torsionfree abelian groups is complete analytic, a necessary but not sufficient condition for Borel completeness, as recalled in Fact 1.7. This was of course possible evidence that the isomorphism relation was indeed Borel complete, as conjectured in 4 . Despite this advancement, the problem of Borel completeness of countable torsionfree abelian groups resisted for other 12 years, until this day, when we prove:

Main Theorem. The space $\mathrm{TFAB}_{\omega}$ is Borel complete, in fact there exists a continous map B: $\operatorname{Graph}_{\omega} \rightarrow \mathrm{TFAB}_{\omega}$ s.t. for every $H_{1}, H_{2}, \in \mathrm{Graph}_{\omega}$ we have:

$$
H_{1} \cong H_{2} \text { if and only if } \mathbf{B}\left(H_{1}\right) \cong \mathbf{B}\left(H_{2}\right)
$$

The techniques employed in the proof of our Main Theorem lead us to (and at the same time were inspired by) classification questions of "rigid" countable abelian groups. One of the most important notions of rigidity in abelian group theory is the notion of endorigidity, where we say that $G \in \mathrm{AB}$ is endorigid if the only endomorphisms of $G$ are multiplication by an integer. The analysis of endorigid abelian groups is an old topic in abelian group theory, famous in this respect is the result of the second author [16] that for every infinite cardinal $\lambda$ there is an endorigid torsion-free abelian group of cardinality $\lambda$. We prove in Thereom 1.10 below that the classification of the countable endorigid TFAB is an highly untractable problem.
Theorem 1.10. The set of endorigid torsion-free abelian groups is a complete coanalytic subset of the Borel space space $\mathrm{TFAB}_{\omega}$. In fact, more strongly, there is $a$ Borel function $\mathbf{F}$ from the set of tree with domain $\omega$ into $\mathrm{TFAB}_{\omega}$ such that:
(i) if $T$ is well-founded, then $\mathbf{F}(T)$ is endorigid;
(ii) if $T$ is not well-founded, then $\mathbf{F}(T)$ has a 1-to-1 $f \in \operatorname{End}(G)$ which is not multiplication by an integer and such that $G / f[G]$ is not torsion.

In 13 we extend the ideas behind Theorem 1.10 to a systematic investigation of several classification problems for various rigidity conditions on abelian and nilpotent groups from the perspective of descriptive set theory of countable structures. In another direction, in [14] we study the question of existence of uncountable (co-)Hopfian abelian groups, this work was later continued by the second author et al. in the preprint [1], which settles some questions left open in (14].

We conclude with a few words on the history of this article. At the end of the refereeing process, the referee indicated some points which needed correction in the original version of this paper. Around the same time, Laskowski and Ulrich indicated another point which needed correction in our original submission. The referee also asked to change the presentation of our Main Theorem and to simply its proof, in particular separating the algebra from the combinatorics (division which is reflected by the current division in Sections 3 and 4). Here all the points raised there are addressed. We thank the anonymous referee, Laskowski and Ulrich. Meanwhile, Laskowski and Ulrich have found another proof of our Main Theorem, see [9, 10.

## 2. Notations and Preliminaries

For the readers of various backgrounds we try to make the paper self-contained.

### 2.1. General notations

Definition 2.1. (1) Given a set $X$ we write $Y \subseteq_{\omega} X$ for $\emptyset \neq Y \subseteq X$ and $|Y|<\aleph_{0}$. (2) Given a set $X$ and $\bar{x}, \bar{y} \in X^{<\omega}$ we write $\bar{y} \triangleleft \bar{x}$ to mean that $\lg (\bar{y})<\lg (\bar{x})$ and $\bar{x} \upharpoonright \lg (\bar{y})=\bar{y}$, where $\bar{x}$ is naturally considered as a function $\lg (\bar{x}) \rightarrow X$.
(3) Given a partial function $f: M \rightarrow M$, we denote by $\operatorname{dom}(f)$ and $\operatorname{ran}(f)$ the domain and the range of $f$, respectively.
(4) For $\bar{a} \in B^{n}$ we write $\bar{a} \subseteq B$ to mean that $\operatorname{ran}(\bar{a}) \subseteq B$, where, as usual, $\bar{a}$ is considered as a function $\{0, \ldots, n-1\} \rightarrow B$.
(5) Given a sequence $\bar{f}=\left(f_{i}: i \in I\right)$ we write $f \in \bar{f}$ to mean that there exists $j \in I$ such that $f=f_{j}$.

### 2.2. Groups

Notation 2.2. Let $G$ and $H$ be groups.
(1) $H \leqslant G$ means that $H$ is a subgroup of $G$.
(2) We let $G^{+}=G \backslash\left\{e_{G}\right\}$, where $e_{G}$ is the neutral element of $G$.
(3) If $G$ is abelian we might denote the neutral element $e_{G}$ simply as $0_{G}=0$.

Definition 2.3. Let $H \leqslant G$ be groups, we say that $H$ is pure in $G$, denoted by $H \leqslant_{*}$ $G$, when if $h \in H, 0<n<\omega, g \in G$ and (in additive notation) $G \models n g=h$, then there is $h^{\prime} \in H$ s.t. $H \models n h^{\prime}=h$. Given $S \subseteq G$ we denote by $\langle S\rangle_{S}^{*}$ the pure subgroup generated by $S$ (the intersection of all the pure subgroups of $G$ containing $S$ ).
Observation 2.4. $H \leqslant_{*} G \in \mathrm{TFAB}, h \in H, 0<n<\omega, G \models n g=h \Rightarrow g \in H$.
Observation 2.5. Let $G \in \mathrm{TFAB}, p$ a prime and let:

$$
G_{p}=\left\{a \in G: a \text { is divisible by } p^{m}, \text { for every } 0<m<\omega\right\}
$$

then $G_{p}$ is a pure subgroup of $G$.
Proof. This is well-known, see e.g. the discussion in [5, pg. 386-387].

Definition 2.6. Let $p$ be a prime. We let:

$$
\mathbb{Q}_{p}=\left\{\frac{m_{1}}{m_{2}}: m_{1} \in \mathbb{Z}, m_{2} \in \mathbb{Z}^{+}, p \text { and } m_{2} \text { are coprime }\right\}
$$

### 2.3. Trees

Definition 2.7. Given an L-structure $M$ by a partial automorphism of $M$ we mean a partial function $f: M \rightarrow M$ such that $f:\langle\operatorname{dom}(f)\rangle_{M} \cong\langle\operatorname{ran}(f)\rangle_{M}$.

In Section 5 we shall use the following notions.
Definition 2.8. Let $\left(T,<_{T}\right)$ be a strict partial order.
(1) $\left(T,<_{T}\right)$ is a tree when, for all $t \in T,\left\{s \in T: s<_{T} t\right\}$ is well-ordered by the relation $<_{T}$. Notice that according to our definition a tree $\left(T,<_{T}\right)$ might have more than one root, i.e. more than one $<_{T}$-minimal element. We say that the tree $\left(T,<_{T}\right)$ is rooted when it has only one $<_{T}$-minimal element (its root).
(2) A branch of the tree $\left(T,<_{T}\right)$ is a maximal chain of the partial order $\left(T,<_{T}\right)$.
(3) A tree $\left(T,<_{T}\right)$ is said to be well-founded if it has only finite branches.
(4) Given a tree $\left(T,<_{T}\right)$ and $t \in T$ we let the level of $t$ in $\left(T,<_{T}\right)$, denoted as $\operatorname{lev}(t)$, to be the order type of $\left\{s \in T: s<_{T} t\right\}$ (recall item (1)).

Remark 2.9. Concerning Def. 2.8(4), we will only consider trees $\left(T,<_{T}\right)$ such that, for every $t \in T,\left\{s \in T: s{<_{T}} t\right\}$ is finite, so for us $\operatorname{lev}(t) \in \omega$.

## 3. The Combinatorial Frame

The isomorphism problem for countable models of the theory of two equivalence relations is known to be at least as complex as the isomorphism problem for any other Borel class of countable structures (cf. e.g. [12, pg. 295]). In what follows we will reduce this problem to the isomorphism problem for countable TFAB's. Our reduction will consist of an elaborated coding of finite partial automorphisms $g$ 's of models with two equivalence relations into partial automorphisms $f_{g}$ 's of TFAB's. For technical reasons we will actually work with finite sequences $\bar{g}$ of finite partial automorphisms, and to avoid the troublesome case $g=g^{-1}$ we will actually work with objects of the form ( $\left.\bar{g}, \iota\right)$ with $\iota \in$ $\{0,1\}$. Finally, also for technical reasons, we will consider models of the theory of three equivalence relation, with one of them being equality.

The definition of $\mathfrak{m} \in \mathrm{K}_{2}^{\mathrm{bo}}(M)$ which we will introduce in Definition 3.4 is phrased just to construct a certain $G_{M} \in \mathrm{TFAB}$ (see Definition 4.3), for any relevant $M$, and in fact, as we will seee, it will suffice (and it will be very useful to do so) to construct such a $G_{M}$ just for $M$ the countable homogeneous universal model of the theory of two equivalence relations, cf. $3.2(22)$. In this regard, below $X$ will serve as set of generators for $G_{M}$ (in the appropriate sense) and $a \in M$ will be coded as $X_{\{a\}}^{\prime} \subseteq X$ (in a certain sense). As the $f_{\bar{g}}$ 's are finite partial automorphisms related to the partial automorphisms in $\bar{g}$, it is natural to ask that if $\bar{g}=\left(g_{0}, \ldots, g_{n}\right)$, then $f_{\bar{g}}$ maps elements in $\operatorname{dom}\left(f_{\bar{g}}\right) \cap X_{\{a\}}^{\prime}$ into elements in $X_{\left\{g_{n}(a)\right\}}^{\prime}$. Almost all clauses in Definition 3.4 right below are combinatorial, but, not surprisingly, one is more algebraic, namely clause (8). As it will be clear from reading Section 4 below, this clause is crucial in reconstructing an isomorphism between models of the theory of two equivalence relations from an isomorphism between $\mathrm{TFAB}_{\omega}$ 's.

Notation 3.1. For $Z$ a set and $0<n<\omega$, we let $\operatorname{seq}_{n}(Z)=\left\{\bar{x} \in Z^{n}: \bar{x}\right.$ injective $\}$.

Hypothesis 3.2. (1) $\mathbf{K}^{\mathrm{eq}}$ is the class of models $M$ in a vocabulary $\left\{\mathfrak{E}_{0}, \mathfrak{E}_{1}, \mathfrak{E}_{2}\right\}$ such that each $\mathfrak{E}_{i}^{M}$ is an equivalence relation and $\mathfrak{E}_{2}^{M}$ is the equality relation. We use the symbol $\mathfrak{E}_{i}$ to avoid confusions, as the symbol $E_{i}$ appears in 3.4 .
(2) $M$ is the countable homogeneous universal model in $\mathbf{K}^{\mathrm{eq}}$.
(3) $\mathcal{G}$ is essentially the set of finite non-empty partial automorphisms $g$ of $M$ but for technical reason ${ }^{2}$ it is the set of objects $g=\left(\mathbf{h}_{g}, \iota_{g}\right)$ where:
(A) (a) $\mathbf{h}_{g}$ is a finite non-empty partial automorphism of $M$;
(b) $\iota_{g} \in\{0,1\}$;
(B) for $g \in \mathcal{G}$ we let:
(a) $g^{-1}=\left(\mathbf{h}_{g}^{-1}, 1-\iota_{g}\right) ;$
(b) for $a \in M, g(a)=\mathbf{h}_{g}(a)$;
(c) for $\mathcal{U} \subseteq M, g[\mathcal{U}]=\left\{\mathbf{h}_{g}(a): a \in \mathcal{U}\right\}$;
(d) $g_{1} \subseteq g_{2}$ means $\mathbf{h}_{g_{1}} \subseteq \mathbf{h}_{g_{2}}$ and $\iota_{g_{1}}=\iota_{g_{2}}$;
(e) $g_{1} \subsetneq g_{2}$ means $g_{1} \subseteq g_{2}$ and $g_{1} \neq g_{2}$;
(f) $\operatorname{dom}(g)=\operatorname{dom}\left(\mathbf{h}_{g}\right)$ and $\operatorname{ran}(g)=\operatorname{ran}\left(\mathbf{h}_{g}\right)$;
(g) for $\mathcal{U} \subseteq M, g \upharpoonright \mathcal{U}=\left(\mathbf{h}_{g} \upharpoonright \mathcal{U}, \iota_{g}\right)$.
(4) For $m<\omega, \mathcal{G}_{*}^{m}=\left\{\left(g_{0}, \ldots, g_{m-1}\right) \in \mathcal{G}^{m}: g_{0} \subsetneq \cdots \subsetneq g_{m-1}\right\}$.
(5) $\mathcal{G}_{*}=\bigcup\left\{\mathcal{G}_{*}^{m}: m<\omega\right\}$ (notice that the empty sequence belongs to $\mathcal{G}_{*}$ ).

Notation 3.3. (1) We use $s, t, \ldots$ to denote finite non-empty subsets of $M$ and $\mathcal{U}, \mathcal{V}, \ldots$ to denote arbitrary subsets of $M$. Recall from 2.1 that $\subseteq_{\omega}$ means finite subset.
(2) For $A$ a set, we let $s \subseteq_{1} A$ mean $s \subseteq A$ and $|s|=1$.
(3) For $\bar{g}=\left(g_{0}, \ldots, g_{\lg (\bar{g})-1}\right) \in \mathcal{G}_{*}^{\lg (\bar{g})}$ and $s, t \subseteq_{\omega} M$, we let:
(a) for $a, b \in M, \bar{g}(a)=b$ mean that $g_{\lg (\bar{g})-1}(a)=b$;
(b) $\bar{g}[s]=t$ mean that $g_{\lg (\bar{g})-1}[s]=t$;
(c) $\operatorname{dom}(\bar{g})=\operatorname{dom}\left(g_{\lg (\bar{g})-1}\right)$, and $\emptyset$ if $\lg (\bar{g})=0$;
(d) $\operatorname{ran}(\bar{g})=\operatorname{ran}\left(g_{\lg (\bar{g})-1}\right)$, and $\emptyset$ if $\lg (\bar{g})=0$;
(e) $\bar{g}^{-1}=\left(g_{i}^{-1}: i<\lg (\bar{g})\right)$;
(f) $\bar{g}\left(\left(x_{\ell}: \ell<n\right)\right)=\left(\bar{g}\left(x_{\ell}\right): \ell<n\right)$.

Definition 3.4. In the context of Hyp. 3.2, let $\mathrm{K}_{2}^{\mathrm{bo}}(M)$ be the class of objects (called systems) $\mathfrak{m}(M)=\mathfrak{m}=\left(X^{\mathfrak{m}}, \bar{X}^{\mathfrak{m}}, \overline{f^{\mathfrak{m}}, E^{\mathfrak{m}}}\right)=(X, \bar{X}, \bar{f}, \bar{E})$ such that:
(1) $X$ is an infinite countable set and $X \subseteq \omega$;
(2) (a) $\left(X_{s}^{\prime}: s \subseteq_{1} M\right)$ is a partition of $X$ into infinite sets;
(b) for $s \subseteq_{\omega} M$, let $X_{s}=\bigcup_{t \subseteq_{1} s} X_{t}^{\prime}$;
(c) $\bar{X}=\left(X_{s}: s \subseteq_{\omega} M\right)$ and so $s \subseteq t \subseteq_{\omega} M$ implies $X_{s} \subseteq X_{t}$;
(3) for $\mathcal{U} \subseteq M$ let $X_{\mathcal{U}}=\bigcup\left\{X_{s}: s \subseteq_{1} \mathcal{U}\right\}$ and so $X=X_{M}=\bigcup\left\{X_{s}: s \subseteq_{1} M\right\}$;
(4) $\bar{f}=\left(f_{\bar{g}}: \bar{g} \in \mathcal{G}_{*}\right)$ (recall the definition of $\mathcal{G}_{*}$ from 3.2)(5)) and:
(a) $f_{\bar{g}}$ is a finite partial bijection of $X$ and $f_{\bar{g}}$ is the empty function iff $\lg (\bar{g})=0$;
(b) $\operatorname{dom}\left(f_{\bar{g}}\right) \subseteq X_{\operatorname{dom}(\bar{g})}$ and $\operatorname{ran}\left(f_{\bar{g}}\right) \subseteq X_{\operatorname{ran}(\bar{g})}(c f .3 .3(3 c)(3 d))$, so $\operatorname{dom}\left(f_{()}\right)=\emptyset$;
(c) for $s, t \subseteq_{1} M$ and $\bar{g}[s]=t$ we have:

$$
f_{\bar{g}}(x)=y \text { implies }\left(x \in X_{s}^{\prime} \text { iff } y \in X_{t}^{\prime}\right)
$$

(d) for $s, t \subseteq_{1} M,\left(f_{\bar{g}}(x)=y, x \in X_{s}^{\prime}, y \in X_{t}^{\prime}\right)$ implies $(\bar{g}[s]=t)$;
(e) $f_{\bar{g}^{-1}}=f_{\bar{g}}^{-1}$ (recall that $\bar{g}^{-1} \neq \bar{g}$, when $\left.\operatorname{dom}(\bar{g}) \neq \emptyset\right)$;
(5) $\bar{g}, \bar{g}^{\prime} \in \mathcal{G}_{*}, \bar{g} \triangleleft \bar{g}^{\prime} \Rightarrow f_{\bar{g}} \subsetneq f_{\bar{g}^{\prime}}$;

[^2](6) we define the graph $\left(\operatorname{seq}_{n}(X), R_{n}^{\mathfrak{m}}\right)$ as $(\bar{x}, \bar{y}) \in R_{n}^{\mathfrak{m}}=R_{n}$ when $\bar{x} \neq \bar{y}$ and:
for some $\bar{g} \in \mathcal{G}_{*}$ we have $f_{\bar{g}}(\bar{x})=\bar{y}$,
notice that $f_{\bar{g}}^{-1}=f_{\bar{g}-1} \in \bar{f}$, as $\bar{g} \in \mathcal{G}_{*}$ implies $\bar{g}^{-1} \in \mathcal{G}_{*}$;
(7) $\bar{E}^{\mathfrak{m}}=\bar{E}=\left(E_{n}: 0<n<\omega\right)=\left(E_{n}^{\mathfrak{m}}: 0<n<\omega\right)$, and, for $0<n<\omega$, $E_{n}$ is the equivalence relation corresponding to the partition of $\operatorname{seq}_{n}(X)$ given by the connected components of the graph $\left(\operatorname{seq}_{n}(X), R_{n}\right)$;
(8) if $p$ is a prime, $k \geqslant 2, \bar{x} \in \operatorname{seq}_{k}(X), \mathbf{y}=\left(\bar{y}^{i}: i<i_{*}\right) \in\left(\bar{x} / E_{k}^{\mathfrak{m}}\right)^{i_{*}}$, with the $\bar{y}^{i}$,s pairwise distinct, $\bar{r} \in \mathbb{Q}^{\mathbf{y}}, q_{\ell} \in \mathbb{Q}_{p}$, for $\ell<k$, and:
$$
a_{(\mathbf{y}, \bar{r})}(y)=a_{(\mathbf{y}, \bar{r}, y)}=\sum\left\{r_{\bar{y}} q_{\ell}: \ell<k, \bar{y}=\bar{y}^{i}, i<i_{*}, y=y_{\ell}^{i}\right\}
$$
for $y \in \operatorname{set}(\mathbf{y})=\bigcup\left\{\operatorname{ran}\left(\bar{y}^{i}\right): i<i_{*}\right\}$, then we have the following:
$$
\left|\left\{y \in \operatorname{set}(\mathbf{y}): a_{(\mathbf{y}, \bar{r})}(y) \notin \mathbb{Q}_{p}\right\}\right| \neq 1,
$$
where we recall that $\mathbb{Q}_{p}$ was defined in Definition 2.6 ;
(9) if for every $n<\omega, g_{n} \in \mathcal{G}$ and $g_{n} \subsetneq g_{n+1}, \mathcal{U}=\bigcup_{n<\omega} \operatorname{dom}\left(g_{n}\right) \subseteq M$ and $\mathcal{V}=\bigcup_{n<\omega} \operatorname{ran}\left(g_{n}\right) \subseteq M$, then we have the following:
$$
\bigcup_{n<\omega} \operatorname{dom}\left(f_{\left(g_{\ell}: \ell<n\right)}\right)=X_{\mathcal{U}} \text { and } \bigcup_{n<\omega} \operatorname{ran}\left(f_{\left(g_{\ell}: \ell<n\right)}\right)=X_{\mathcal{V}}
$$

The definition of $\mathfrak{m} \in \mathrm{K}_{2}^{\text {bo }}(M)$ from 3.4 isolates exactly what is needed for the group theoretic construction from Section 4 to take place. The rest of this section has as its sole purpose to show that an object as in Definition 3.4 exists. To this extent, we introduce an auxiliary class of objects, $\mathrm{K}_{1}^{\mathrm{bo}}(M)$, cf. Definition 3.5 . This definition is devised with a twofold aim in mind: on one hand to put more detailed information on the objects at play in Definition 3.4, and on the other hand to be able to construct the desired $\mathfrak{m} \in \mathrm{K}_{2}^{\text {bo }}(M)$ as a limit of a sequence of approximations $\mathfrak{m}_{\ell} \in \mathrm{K}_{1}^{\mathrm{bo}}(M)$, for $\ell<\omega$, of such an $\mathfrak{m} \in \mathrm{K}_{2}^{\mathrm{bo}}(M)$. In this process the crucial algebraic condition (8) from Definition 3.4 gets translated in the more technical algebraic condition (11) from Definition 3.5, showing that this condition is preserved in the limit construction will be the most elaborated part of this section.
Definition 3.5. In the context of Hyp. 3.2, let $\mathrm{K}_{1}^{\mathrm{bo}}(M)$ be the class of objects $\mathfrak{m}(M)=\mathfrak{m}=\left(X^{\mathfrak{m}}, \bar{X}^{\mathfrak{m}}, I^{\mathfrak{m}}, \bar{I}^{\mathfrak{m}}, \bar{f}^{\mathfrak{m}}, \bar{E}^{\mathfrak{m}}, Y_{\mathfrak{m}}\right)=(X, \bar{X}, I, \bar{I}, \bar{f}, \bar{E}, Y)$ s.t.:
(1) $X$ is an infinite countable set and $X \subseteq \omega$;
(2) (a) $\left(X_{s}^{\prime}: s \subseteq_{1} M\right)$ is a partition of $X$ into infinite sets;
(b) for $s \subseteq_{\omega} M$, let $X_{s}=\bigcup_{t \subseteq_{1} s} X_{t}^{\prime}$;
(c) $\bar{X}=\left(X_{s}: s \subseteq_{\omega} M\right)$ and so $s \subseteq t \subseteq_{\omega} M$ implies $X_{s} \subseteq X_{t}$;
(3) for $\mathcal{U} \subseteq M$ let $X_{\mathcal{U}}=\bigcup\left\{X_{s}: s \subseteq_{1} \mathcal{U}\right\}$ and so $X=X_{M}=\bigcup\left\{X_{s}: s \subseteq_{1} M\right\}$;
(4) (a) $\bar{I}=\left(I_{n}: n<\omega\right)=\left(I_{n}^{\mathfrak{m}}: n<\omega\right)$ are pairwise disjoint;
(b) $\bar{g} \in I_{n}$ implies $\bar{g} \in \mathcal{G}_{*}^{m}$ for some $m \leqslant n$;
(c) $I_{n}$ is finite;
(5) if $\bar{g}^{\prime} \triangleleft \bar{g} \in I_{n}$, then $\bar{g}^{\prime} \in I_{<n}:=\bigcup_{\ell<n} I_{\ell}$;
(6) $I=I^{\mathfrak{m}}=\bigcup_{n<\omega} I_{n}$;
(7) $\bar{f}=\left(f_{\bar{g}}: \bar{g} \in I\right)$ and:
(a) $f_{\bar{g}}$ is a finite partial bijection of $X$ and $f_{\bar{g}}$ is the empty function iff $\lg (\bar{g})=0$;
(b) $\operatorname{dom}\left(f_{\bar{g}}\right) \subseteq X_{\operatorname{dom}(\bar{g})}$ and $\operatorname{ran}\left(f_{\bar{g}}\right) \subseteq X_{\operatorname{ran}(\bar{g})}$ (cf. Notation 3.3 (3c) (3d));
(c) for $s, t \subseteq_{1} M$ and $\bar{g}[s]=t$ we have:

$$
f_{\bar{g}}(x)=y \text { implies }\left(x \in X_{s}^{\prime} \text { iff } y \in X_{t}^{\prime}\right)
$$

(d) for $s, t \subseteq_{1} M,\left(f_{\bar{g}}(x)=y, x \in X_{s}^{\prime}, y \in X_{t}^{\prime}\right)$ implies $(\bar{g}[s]=t)$;
(e) if $\bar{g} \in I_{n}$, then $\bar{g}^{-1} \in I_{n}$ and $f_{\bar{g}^{-1}}=f_{\bar{g}}^{-1}$;
(8) $\bar{g} \triangleleft \bar{g}^{\prime} \Rightarrow f_{\bar{g}} \subsetneq f_{\bar{g}^{\prime}}$;
(9) we define the graph $\left(\operatorname{seq}_{n}(X), R_{n}^{\mathfrak{m}}\right)$ as $(\bar{x}, \bar{y}) \in R_{n}^{\mathfrak{m}}=R_{n}$ when $\bar{x} \neq \bar{y}$ and:

$$
\text { for some } \bar{g} \in I \text { we have } f_{\bar{g}}(\bar{x})=\bar{y}
$$

notice that $f_{\bar{g}}^{-1}=f_{\bar{g}^{-1}} \in \bar{f}$, as $\bar{g} \in I$ implies $\bar{g}^{-1} \in I$;
(a) $\bar{E}^{\mathfrak{m}}=\bar{E}=\left(E_{n}: n<\omega\right)=\left(E_{n}^{\mathfrak{m}}: n<\omega\right)$, and, for $n<\omega$, $E_{n}$ is the equivalence relation corresponding to the partition of $\operatorname{seq}_{n}(X)$ given by the connected components of the graph $\left(\operatorname{seq}_{n}(X), R_{n}\right)$;
(b) $Y=Y_{\mathfrak{m}}$ is a non-empty subset of $X$ which includes the following set:

$$
\left\{x \in X: \text { for some } \bar{g} \in I, x \in \operatorname{dom}\left(f_{\bar{g}}\right)\right\}
$$

notice that this inclusion may very well be proper;
(c) $\operatorname{seq}_{k}(\mathfrak{m})=\left\{\bar{x} \in \operatorname{seq}_{k}(X)\right.$ : for some $\left.\bar{g} \in I, \bar{x} \subseteq \operatorname{dom}\left(f_{\bar{g}}\right)\right\}$, notice $\operatorname{seq}_{k}(\mathfrak{m}) \subseteq$ $\operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right)$ but the converse need not hold;
(11) if $p$ is a prime, $k \geqslant 2, \bar{x} \in \operatorname{seq}_{k}(X), \bar{q} \in\left(\mathbb{Q}_{p}\right)^{k}, \mathfrak{s}=(p, k, \bar{x}, \bar{q})$ and $\bar{a} \in \mathcal{A}_{\mathfrak{s}}$, then $\operatorname{supp}_{p}(\bar{a})$ is not a singleton, where we define $\mathcal{A}_{\mathfrak{s}}, \mathcal{A}_{\mathfrak{m}}$ and $\operatorname{supp}_{p}(\bar{a})$ as follows:
(a) $\mathcal{A}_{\mathfrak{s}} \subseteq \mathcal{A}_{\mathfrak{m}}=\left\{\left(a_{y}: y \in Z\right): Z \subseteq_{\omega} X\right.$ and $\left.a_{y} \in \mathbb{Q}\right\}$;
(b) if $\bar{a} \in \mathcal{A}_{\mathfrak{m}}$, then we let:

$$
\operatorname{supp}_{p}(\bar{a})=\left\{y \in \operatorname{dom}(\bar{a}): a_{y} \notin \mathbb{Q}_{p}\right\}
$$

(c) if $\mathbf{y}=\left(\bar{y}^{i}: i<i_{*}\right) \in\left(\bar{x} / E_{k}^{\mathfrak{m}}\right)^{i_{*}}$ (but abusing notation we may treat $\mathbf{y}$ as a set), with the $\bar{y}^{i}$ 's pairwise distinct and $\bar{r} \in \mathbb{Q}^{\mathbf{y}}$, then $\bar{a} \in \mathcal{A}_{\mathfrak{s}}$, where:

$$
\bar{a}=\bar{a}_{(\mathbf{y}, \bar{r})}=\left(a_{y}: y \in \operatorname{set}(\mathbf{y})\right)
$$

and where $a_{y}$ and $\operatorname{set}(\mathbf{y})$ are defined as follows:

$$
\begin{aligned}
a_{y}=a_{(\mathbf{y}, \bar{r})}(y)=a_{(\mathbf{y}, \bar{r}, y)} & =\sum\left\{r_{\bar{y}} q_{\ell}: \ell<k, \bar{y}=\bar{y}^{i}, i<i_{*}, y=y_{\ell}^{i}\right\}, \\
\operatorname{set}(\mathbf{y}) & =\bigcup\left\{\operatorname{ran}\left(\bar{y}^{i}\right): i<i_{*}\right\}
\end{aligned}
$$

(d) if $\bar{a} \in \mathcal{A}_{\mathfrak{s}}$ and $\operatorname{supp}_{p}(\bar{a}) \subseteq Z \subseteq \operatorname{dom}(\bar{a})$, then $\bar{a} \upharpoonright Z \in \mathcal{A}_{\mathfrak{s}}$;
(e) if $\bar{a}, \bar{b} \in \mathcal{A}_{\mathfrak{s}}$, then $\bar{c}=\bar{a}+\bar{b} \in \mathcal{A}_{\mathfrak{s}}$, where $\operatorname{dom}(\bar{c})=\operatorname{dom}(\bar{a}) \cup \operatorname{dom}(\bar{b})$ and:
(i) $c_{y}=a_{y}+b_{y}$, if $y \in \operatorname{dom}(\bar{a}) \cap \operatorname{dom}(\bar{b})$;
(ii) $c_{y}=a_{y}$, if $y \in \operatorname{dom}(\bar{a}) \backslash \operatorname{dom}(\bar{b})$;
(iii) $c_{y}=b_{y}$, if $y \in \operatorname{dom}(\bar{b}) \backslash \operatorname{dom}(\bar{a})$;
(f) if $\bar{g} \in I^{\mathfrak{m}}, Z_{1} \subseteq_{\omega} \operatorname{dom}\left(f_{\bar{g}}\right), Z_{2}=f_{\bar{g}}\left[Z_{1}\right]$ and $\bar{a}=\left(a_{y}: y \in Z_{2}\right) \in \mathcal{A}_{\mathfrak{s}}$, then

$$
\bar{a}^{\left[f_{\bar{g}}\right]}=\left(a_{f_{\bar{g}}(y)}: y \in Z_{1}\right) \in \mathcal{A}_{\mathfrak{s}}
$$

(g) $\mathcal{A}_{\mathfrak{s}}$ is the minimal subset of $\mathcal{A}_{\mathfrak{m}}$ satisfying clauses (c)-(f).

As mentioned above, members in $\mathfrak{m} \in \mathrm{K}_{1}^{\mathrm{bo}}(M)$ are to be thought of as approximations to objects in $\mathrm{K}_{2}^{\mathrm{bo}}(M)$, but technically an $\mathfrak{m} \in \mathrm{K}_{1}^{\mathrm{bo}}(M)$ and an $\mathfrak{m} \in \mathrm{K}_{2}^{\mathrm{bo}}(M)$ are made of different components, so we give a name to the objects in $\mathfrak{m} \in \mathrm{K}_{1}^{\mathrm{bo}}(M)$ which which are essentially members of $\mathrm{K}_{2}^{\mathrm{bo}}(M)$, we call them full, see 3.6 .
Definition 3.6. For $\mathfrak{m} \in \mathrm{K}_{1}^{\mathrm{bo}}(M)$, we say that $\mathfrak{m}$ is full when in addition to (1)(11) condition 3.4(9) is satisfied and 3.5 (4) is strengthen to 3.4(4) (that is we ask $I=\mathcal{G}_{*}$ ), explicitly to (1)-(11) from 3.5 we add:
(12) if for every $n<\omega, g_{n} \in \mathcal{G}$ and $g_{n} \subsetneq g_{n+1}, \mathcal{U}=\bigcup_{n<\omega} \operatorname{dom}\left(g_{n}\right) \subseteq M$ and $\mathcal{V}=\bigcup_{n<\omega} \operatorname{ran}\left(g_{n}\right) \subseteq M$, then we have the following:

$$
\bigcup_{n<\omega} \operatorname{dom}\left(f_{\left(g_{\ell}: \ell<n\right)}\right)=X_{\mathcal{U}} \text { and } \bigcup_{n<\omega} \operatorname{ran}\left(f_{\left(g_{\ell}: \ell<n\right)}\right)=X_{\mathcal{V}}
$$

(13) $I=\bigcup_{n<\omega} I_{n}=\mathcal{G}_{*}$.

We shall concentrate on the $\mathfrak{m} \in \mathrm{K}_{1}^{\mathrm{bo}}(M)$ which are, in some sense, with "finite information", i.e., the ones in which both $Y_{\mathfrak{m}}$ and $I^{\mathfrak{m}}$ are finite. Furthermore, we will define a notion of " $\mathfrak{n}$ is a successor of $\mathfrak{m}$ ". These notions are tailor made for our inductive construction of a full $\mathfrak{m} \in \mathrm{K}_{1}^{\mathrm{bo}}(M)$ to take place.
Definition 3.7. (1) $\mathrm{K}_{0}^{\mathrm{bo}}(M)$ is the class of $\mathfrak{m} \in \mathrm{K}_{1}^{\mathrm{bo}}(M)$ such that $Y_{\mathfrak{m}}$ is finite and for some $n<\omega$ we have that for every $m \geqslant n$, $I_{m}=\emptyset$ and $I_{0}=\{()\}$. In this case we let $n=n(\mathfrak{m})$ to be the minimal such $n<\omega($ so $n(\mathfrak{m})>0)$.
(2) We say that $\mathfrak{n} \in \operatorname{suc}(\mathfrak{m})$ when:
(a) $\mathfrak{n}, \mathfrak{m} \in \mathrm{K}_{0}^{\mathrm{bo}}(M), X^{\mathfrak{m}}=X^{\mathfrak{n}}$;
(b) for $s \subseteq_{1} M$, $\left(X_{s}^{\prime}\right)^{\mathfrak{m}}=\left(X_{s}^{\prime}\right)^{\mathfrak{n}}$;
(c) for $t \subseteq_{\omega} M,\left(X_{t}\right)^{\mathfrak{m}}=\left(X_{t}\right)^{\mathfrak{n}}$ (follows);
(d) $n(\mathfrak{n})=n+1$, where $n(\mathfrak{m})=n$;
(e) if $\ell<n(\mathfrak{m})$, then $I_{\ell}^{\mathfrak{m}}=I_{\ell}^{\mathfrak{n}}$ and $\bigwedge_{\bar{g} \in I_{\ell}^{\mathrm{m}}} f_{\bar{g}}^{\mathfrak{m}}=f_{\bar{g}}^{\mathfrak{n}}$;
(f) for some $\bar{g} \in \mathcal{G}_{*}, I_{n}^{\mathfrak{n}}=\left\{\bar{g}, \bar{g}^{-1}\right\}, \lg (\bar{g}) \leqslant n$ and $\ell<\lg (\bar{g})$ implies:

$$
\bar{g} \upharpoonright \ell \in \bigcup_{\ell<n} I_{\ell}^{\mathrm{m}},
$$

notice that $\bar{g} \notin \bigcup_{\ell<n} I_{\ell}^{\mathrm{m}}$ (by Definition 3.5 (4a)) and the symmetric condition $\bar{g}^{-1} \upharpoonright \ell \in \bigcup_{\ell<n} I_{\ell}^{\mathrm{m}}$ follows from Definition 3.5 (7e);
(g) ( $\alpha$ ) if $\bar{x} E_{k}^{\mathfrak{n}} \bar{y}$ and $\neg\left(\bar{x} E_{k}^{\mathfrak{m}} \bar{y}\right)$, then $\bar{x} \notin \operatorname{seq}_{k}(\mathfrak{m})$ or $\bar{y} \notin \operatorname{seq}_{k}(\mathfrak{m})$;
$(\beta) E_{k}^{\mathfrak{n}} \upharpoonright \operatorname{seq}_{k}(\mathfrak{m})=E_{k}^{\mathfrak{m}} \upharpoonright \operatorname{seq}_{k}(\mathfrak{m})$.
(3) $<_{\text {suc }}$ on $\mathrm{K}_{0}^{\mathrm{bo}}(M)$ is the transitive closure of the relation $\mathfrak{n} \in \operatorname{suc}(\mathfrak{m})$.

The heart of this section is the following claim.
Claim 3.8. For $M$ as in Hyp. 3.2, there exists $\mathfrak{m} \in \mathrm{K}_{1}^{\mathrm{bo}}(M)$ which is full.
Proof. Our strategy is to construct a full $\mathfrak{m} \in \mathrm{K}_{1}^{\mathrm{bo}}(M)$ as a limit of members $\mathfrak{m}_{\ell} \in \mathrm{K}_{0}^{\mathrm{bo}}(M)$, for $\ell<\omega$. Naturally, $\mathfrak{m}_{0}$ is not hard to choose, see $(*)_{1}$ below. Concerning the choice of the $\mathfrak{m}_{\ell}$ 's, in $(*)_{3}$ below we list our tasks: for every $\bar{g} \in \mathcal{G}^{*}$ we have a $\bar{g}$-task which is ensuring that $f_{\bar{g}}$ is well-defined. Thus, we list $\mathcal{G}^{*}$ as $\left(\bar{g}_{\ell}: \ell<\omega\right)$ appropriately and in choosing $\mathfrak{m}_{\ell+1}$, a successor of $\mathfrak{m}_{\ell}$, we take care of the $\bar{g}_{\ell}$-task. This lead us to the main part of the proof, namely $(*)_{2}$. Here we are given $\mathfrak{m}$ and appropriate $\bar{g} \frown(g) \in \mathcal{G}^{*}$ such that $\bar{g} \in I_{\mathfrak{m}}$, i.e., $f_{\bar{g}}$ is already welldefined for $\mathfrak{m}$. Our aim is to define a suitable successor $\mathfrak{n}$ of $\mathfrak{m}$ and, in particular, to define $f_{\bar{g} \frown(g)}$ for $\mathfrak{n}$. Moreover to take care of the fullness of the limit we want both $\operatorname{dom}\left(f_{\bar{g} \cap(g)}\right)$ and $Y_{\mathfrak{m}}$ to be large enough, this explains the statement of $(*)_{2}$. $(*)_{1} \mathrm{~K}_{0}^{\mathrm{bo}}(M) \neq \emptyset$.
[Why? Let $\mathfrak{m}$ be such that:
(a) $|X|=\aleph_{0}$, and $X \subseteq \omega$;
(b) $\left(X_{s}^{\prime}: s \subseteq_{1} M\right)$ is a partition of $X$ into infinite sets;
(c) for $s \subseteq_{\omega} M, X_{s}=\bigcup_{t \subseteq_{1} s} X_{t}^{\prime}$;
(d) $\bar{X}=\left(X_{s}: s \subseteq_{\omega} M\right)$;
(e) $I_{0}^{\mathfrak{m}}=\{()\}, f_{()}$is the empty function, $\bar{f}=\left(f_{()}\right)$and $I_{1+n}=\emptyset$, for every $n<\omega$;
(f) $Y_{\mathfrak{m}}$ is any finite non-empty subset of $X$.

Notice that () denotes the empty sequence and under this choice of $\mathfrak{m}, n(\mathfrak{m})=1$, where we recall that the notation $n(\mathfrak{m})$ was introduced in Definition 3.7 1). Notice also that 3.511 is easy to verify for $\mathfrak{m}$ as above, as $\bar{x} / E_{k}^{\mathfrak{m}}$ is always a singleton.]
$(*)_{2}$ If $\mathfrak{m} \in \mathrm{K}_{0}^{\mathrm{bo}}(M), n=n(\mathfrak{m})>0, \bar{g}=\left(g_{0}, \ldots, g_{m-1}\right) \in I^{\mathfrak{m}}($ so $n>m)$ and:
(i) $g \in \mathcal{G}$;
(ii) for every $\ell<m, g_{\ell} \subsetneq g$;
(iii) $\bar{g} \frown(g) \notin I^{\mathfrak{m}}$;
then there is $\mathfrak{n} \in \mathrm{K}_{0}^{\mathrm{bo}}(M)$ such that:
(a) $\mathfrak{n} \in \operatorname{suc}(\mathfrak{m})$;
(b) $\bar{g} \frown(g) \in I_{n}^{\mathfrak{n}}$;
(c) if $s \subseteq_{1} s^{+}=\operatorname{dom}(g) \cup \operatorname{ran}(g)$, then $Y_{\mathfrak{n}}$ contains $\min \left(X_{s}^{\prime} \backslash Y_{\mathfrak{m}}\right)$;
(d) $\operatorname{dom}\left(f_{\bar{g} \cap(g)}^{\mathfrak{n}}\right)=Y_{\mathfrak{m}} \cap X_{\operatorname{dom}(g)}$;
(e) so $n(\mathfrak{n})=n(\mathfrak{m})+1$.

The proof of $(*)_{2}$ is clearly the heart of the proof. The choice of $\mathfrak{n}$ in $(*)_{2.3}$ below is natural: we choose $f_{\bar{g}-(g)}^{\mathfrak{n}}=f_{*}$ "freely", i.e., it extends $f_{\bar{g}}^{\mathfrak{m}}$, it has large enough domain and no "accidental equality" holds. Lastly, $Y_{\mathfrak{n}}$ has to include $Y_{\mathfrak{m}}, \operatorname{ran}\left(f_{*}\right)$ and witnesses toward the proof of fullness $\left(c f .(*)_{2}(c)\right)$, which will be dealt with in the next successor step, so we are making sure that the induction goes on.
We thus move to the proof of $(*)_{2}$, where we let $f_{\bar{g}}^{\mathfrak{m}}=f_{\bar{g}}$.
$(*)_{2.1}$ Let $s_{*}=\operatorname{dom}(g) \subseteq_{\omega} M$, hence $\operatorname{dom}(\bar{g}) \subsetneq s_{*}$ and let $u_{*}=Y_{\mathfrak{m}} \cap X_{s_{*}}$.
$(*)_{2.2}$ Let $f_{*}$ be a finite permutation of $X$ satisfying the following:
(a) $f_{*}$ obeys $3.5(7 \mathrm{a})-(7 \mathrm{~d})$ for $\bar{g} \frown(g)$ and $\operatorname{dom}\left(f_{*}\right)=u_{*}$;
(b) $f_{*}$ extends $f_{\bar{g}}$;
(c) $\operatorname{dom}\left(f_{*}\right) \cap \operatorname{ran}\left(f_{*}\right)=\operatorname{ran}\left(f_{\bar{g}}\right)$;
(d) if $x \in \operatorname{dom}\left(f_{*}\right) \backslash \operatorname{dom}\left(f_{\bar{g}}\right)$ then $f_{*}(x) \notin Y_{\mathfrak{m}}\left(\right.$ so $\left.f_{*}(x) \notin \operatorname{dom}\left(f_{*}\right)\right)$.

We now define $\mathfrak{n}$, as required in $(*)_{2}$.
$(*)_{2.3}$ (A) (a) $X^{\mathfrak{n}}=X^{\mathfrak{m}}$ and $\bar{X}^{\mathfrak{n}}=\bar{X}^{\mathfrak{m}}$;
(b) $I_{n}^{\mathfrak{n}}=\left\{\bar{g}(g),\left(\bar{g}^{-1}\right) \frown\left(g^{-1}\right)\right\}$;
(c) $I^{\mathfrak{n}}=I^{\mathfrak{m}} \cup I_{n}^{\mathfrak{n}}$;
(d) $I_{\ell}^{\mathrm{n}}=I_{\ell}^{\mathrm{m}}$, for $\ell \neq n$;
(e) $f_{\bar{h}}^{\mathfrak{n}}=f_{\bar{h}}^{\mathfrak{m}}$, for $\bar{h} \in I^{\mathfrak{m}}$.
(B) (a) $n(\mathfrak{n})=n+1$;
(b) $f_{\bar{g} \frown(g)}^{\mathfrak{n}}=f_{*}, f_{\left(\bar{g}^{-1}\right) \smile\left(g^{-1}\right)}^{\mathfrak{n}}=f_{*}^{-1}$;
(c) $Y_{\mathfrak{n}}=Z \cup Z^{+}$, where (noticing $f_{*}\left[Y_{\mathfrak{m}}\right]=\operatorname{ran}\left(f_{*}\right)$ ):
$\left({ }_{1}\right) Z=Y_{\mathfrak{m}} \cup f_{*}\left[Y_{\mathfrak{m}}\right]$;
$\left(\cdot{ }_{2}\right) Z^{+}=\left\{\min \left(X_{s}^{\prime} \backslash Y_{\mathfrak{m}}\right): s \subseteq_{1} s^{+}\right\} \backslash Z$, recalling $(*)_{2}(\mathrm{c})$.
The reason for $Z^{+}$in (B)(c) above it to satisfy condition $(*)_{2}(\mathrm{c})$.
$(*)_{2.3 .1} R_{k}^{\mathfrak{n}}$ and $E_{k}^{\mathfrak{n}}$ are defined from the information in $(*)_{2.3}$, as in 3.5 9 .
Comparing $\left(\operatorname{seq}_{k}(X), R_{k}^{\mathfrak{n}}\right)$ and $\left(\operatorname{seq}_{k}(X), R_{k}^{\mathfrak{m}}\right)$ the set of new edges is:

$$
\left\{(\bar{x}, \bar{y}):(\bar{x}, \bar{y}) \in Z_{1}^{k} \cup Z_{-1}^{k}\right\}
$$

where we let:
$(*)_{2.4}$

$$
\begin{gathered}
Z_{1}^{k}=\left\{(\bar{x}, \bar{y}): \bar{x} \in \operatorname{seq}_{k}\left(\operatorname{dom}\left(f_{*}\right)\right), f_{*}(\bar{x})=\bar{y}, \bar{x} \notin \operatorname{seq}_{k}\left(\operatorname{dom}\left(f_{\bar{g}}\right)\right)\right\} \\
Z_{-1}^{k}=\left\{(\bar{x}, \bar{y}):(\bar{y}, \bar{x}) \in Z_{1}^{k}\right\}
\end{gathered}
$$

Notice that possibly $\bar{x} \subseteq \operatorname{dom}\left(f_{*}\right) \wedge \bar{x} \notin \operatorname{seq}_{k}(\mathfrak{m})$, and possibly $\bar{x} \subseteq \operatorname{dom}\left(f_{*}\right) \wedge$ $\bar{x} \nsubseteq \operatorname{dom}\left(f_{\bar{g}}^{\mathfrak{m}}\right) \wedge \bar{x} \in \operatorname{seq}_{k}(\mathfrak{m})$ (as witnessed by some $\bar{g}^{\prime} \in I_{<n}^{\mathfrak{m}}$ ), anyhow the union $Z_{1}^{k} \cup Z_{-1}^{k}$ is disjoint, as $\operatorname{dom}\left(f_{*}\right)=u_{*}$, by $(*)_{2.2}(\mathrm{a}), u_{*} \subseteq Y_{\mathfrak{m}}$, by $(*)_{2.1}$, and $x \in \operatorname{dom}\left(f_{*}\right) \backslash \operatorname{dom}\left(f_{\bar{g}}\right)$ implies $f_{*}(x) \notin Y_{\mathfrak{m}}$, by $(*)_{2.2}(\mathrm{~d})$. Notice now that:
$(*)_{2.4 .1}$ if $\bar{x} \in \operatorname{seq}_{k}\left(u_{*}\right)$ and $\bar{y}=f_{*}(\bar{x})$, then:
$\bar{x} \subseteq \operatorname{dom}\left(f_{\bar{g}}\right) \Leftrightarrow \bar{y} \subseteq \operatorname{ran}\left(f_{\bar{g}}\right) \Rightarrow\left(\bar{x} \in \operatorname{seq}_{k}(\mathfrak{m}) \wedge \bar{y} \in \operatorname{seq}_{k}(\mathfrak{m})\right)$.
Now, we have:
$(*)_{2.5}$ (a) if $(\bar{x}, \bar{y}) \in Z_{1}^{k}$, then:
$(\alpha) \bar{x} \in \operatorname{seq}_{k}\left(u_{*}\right)$ and $\bar{x} \nsubseteq \operatorname{dom}\left(f_{\bar{g}}\right)$;
( $\beta$ ) $\bar{y} \subseteq f_{*}\left(u_{*}\right), \bar{y} \nsubseteq Y_{\mathfrak{m}}, \bar{y} \nsubseteq \operatorname{ran}\left(f_{\bar{g}}\right)$ and $\bar{y} \cap Y_{\mathfrak{m}} \subseteq \operatorname{ran}\left(f_{\bar{g}}\right)$;
(b) the dual of item (a) for $(\bar{x}, \bar{y}) \in Z_{-1}^{k}$;
(c) if $\bar{z} \in \operatorname{seq}_{k}(\mathfrak{n}) \backslash \operatorname{seq}_{k}(\mathfrak{m})$, then $\bar{z}$ occurs in exactly one edge of $R_{k}^{\mathfrak{n}}$.
[Why? Item $(\mathrm{a})(\beta)$ is by $(*)_{2.2}(d)$. Item $(\mathrm{c})$ is by $(*)_{2.2}(c)$.]
Notice now that:
$(*)_{2.6}$ in the graph $\left(\operatorname{seq}_{k}(X), R_{k}^{\mathfrak{n}}\right)$ we have (where $\bar{x} \in \operatorname{seq}_{k}(X)$ below):
(i) all the new edges have at least one node in $\operatorname{seq}_{k}\left(u_{*}\right) \backslash \operatorname{seq}_{k}\left(\operatorname{dom}\left(f_{\bar{g}}\right)\right)$
and one in $\operatorname{seq}_{k}\left(f_{*}\left[u_{*}\right]\right) \backslash \operatorname{seq}_{k}\left(\operatorname{ran}\left(f_{\bar{g}}\right)\right)=\operatorname{seq}_{k}\left(f_{*}\left[u_{*}\right]\right) \backslash \operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right) ;$
(ii) every node in $\operatorname{seq}_{k}(\mathfrak{n}) \backslash \operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right)$ has valency 1 ;
(iii) if $\bar{x} \nsubseteq Y_{\mathfrak{m}}$ and $\bar{x} \nsubseteq \operatorname{ran}\left(f_{*}\right)$, then $\bar{x} / E_{k}^{\mathfrak{n}}=\{\bar{x}\}$;
(iv) if $\bar{x} \subseteq Y_{\mathfrak{m}}$ and $\bar{x} \nsubseteq \operatorname{dom}\left(f_{*}\right)$, then $\bar{x} / E_{k}^{\mathfrak{n}}=\bar{x} / E_{k}^{\mathfrak{m}}$;
(v) if $\bar{x} \subseteq \operatorname{dom}\left(f_{*}\right)$ (hence $\bar{x} \subseteq Y_{\mathfrak{m}}$ ), then:

$$
\bar{x} / E_{k}^{\mathfrak{n}}=\bar{x} / E_{k}^{\mathfrak{m}} \cup\left\{f_{*}(\bar{y}): \bar{y} \in \bar{x} / E_{k}^{\mathfrak{m}}, \bar{y} \subseteq u_{*}, \bar{y} \nsubseteq \operatorname{dom}\left(f_{\bar{g}}\right)\right\} ;
$$

(vi) if $\bar{x} \subseteq \operatorname{dom}\left(f_{\bar{g}}\right)$ and $\bar{x} / E_{k}^{\mathfrak{m}} \cap \operatorname{seq}_{k}\left(u_{*}\right) \subseteq \operatorname{seq}_{k}\left(\operatorname{dom}\left(f_{\bar{g}}\right)\right)$, then:

$$
\bar{x} / E_{k}^{\mathfrak{n}}=\bar{x} / E_{k}^{\mathfrak{m}}=f_{*}(\bar{x}) / E_{k}^{\mathfrak{m}}
$$

(vii) if $\bar{x} \nsubseteq Y_{\mathfrak{m}}$ but $\bar{x} \subseteq f_{*}\left(u_{*}\right)$, then $\bar{x} / E_{k}^{\mathfrak{n}}=f_{*}^{-1}(\bar{x}) / E_{k}^{\mathfrak{n}}$;
(viii) if $\bar{x} \in \operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right)$, then:

$$
\left(\bar{x} / E_{k}^{\mathfrak{n}}\right) \cap \operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right)=\left(\bar{x} / E_{k}^{\mathfrak{m}}\right) \cap \operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right)
$$

Notice also that:
$(*)_{2.6 .1}$ (a) if $\bar{x}_{0}, \ldots, \bar{x}_{m}$ is a path in $\left(\operatorname{seq}_{k}(\mathfrak{n}), R_{k}^{\mathfrak{n}}\right)$ with no repetitions and $0<\ell<$ $m$, then $\bar{x}_{\ell} \in \operatorname{seq}_{k}(\mathfrak{m})$;
(b) $E_{k}^{\mathfrak{n}} \upharpoonright \operatorname{seq}_{k}(\mathfrak{m})=E_{k}^{\mathfrak{m}} \upharpoonright \operatorname{seq}_{k}(\mathfrak{m})$ and $E_{k}^{\mathfrak{n}} \upharpoonright \operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right)=E_{k}^{\mathfrak{m}} \upharpoonright \operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right)$;

Now, we claim:
$(*)_{2.7} \mathfrak{n} \in \mathrm{~K}_{0}^{\mathrm{bo}}(M)$ and $\mathfrak{n} \in \operatorname{suc}(\mathfrak{m})$.
The only non-trivial thing is to verify that $\mathfrak{n}$ satisfies 3.5,11. In principle, verifying that this holds should be straightforward. As $\mathfrak{n}$ is explicitly defined in an essentially free manner, we should be able to check the algebraic condition $3.5(11$. In actuality, though, verifying $3.5\left(11\right.$ would require an explicit description of $\overline{\mathcal{A}_{\mathfrak{s}}^{\mathfrak{n}}}$. We circumvent this by defining explicitly an $\mathcal{A}^{\prime}$ such that $\mathcal{A}_{\mathfrak{s}}^{\mathfrak{n}} \subseteq \mathcal{A}^{\prime}\left(\right.$ cf. $\left.(*)_{2.7 .5}\right)$ and such that $\mathcal{A}^{\prime}$ satisfies the crucial condition that each $\bar{a} \in \mathcal{A}^{\prime}$ has non singleton $p$-support (cf. $\left.(*)_{2.7 .6}\right)$. Notice that in order to show that $\mathcal{A}_{\mathfrak{s}}^{\mathfrak{n}} \subseteq \mathcal{A}^{\prime}$ it suffices to show that $\mathcal{A}^{\prime}$
satisfies the minimal set of condition defining $\mathcal{A}_{\mathfrak{s}}^{\mathfrak{n}}$, as defined in 3.5 11, and so it is not hard to achieve, although the proof requires careful checking. Also the proof $(*)_{2.7 .6}$ is in principle not hard but it involves a careful checking of many cases.
We thus move to the proof of $3.5,11$. To this extent:
$(*)_{2.7 .0}$ let $\mathfrak{s}=(p, k, \bar{x}, \bar{q})$ be as in 3.5 11.
Now, if $\bar{x} \notin \operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right)$ and $\bar{x} \notin \operatorname{seq}_{k}\left(\operatorname{ran}\left(f_{*}\right)\right)$, then $\bar{x} / E_{k}^{\mathfrak{n}}$ is a singleton and so the proof is as in $(*)_{1}$. Thus, from now on we assume:
$(*)_{2.7 .1}$ W.l.o.g. $\bar{x} \in \operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right)$ or $\bar{x} \in \operatorname{seq}_{k}\left(\operatorname{ran}\left(f_{*}\right)\right)$.
$(*)_{2.7 .2}$ (a) W.l.o.g. $\bar{x} \in \operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right)$;
(b) let $\mathfrak{s}$ be is as in $3.5,11$ for $\mathfrak{m}$ and $\bar{x}$;
(c) so $\mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}}$ is well-defined.
[Why (a)? If $\bar{x} \nsubseteq Y_{\mathfrak{m}}$, then, by $(*)_{2.7 .1}$, necessarily $\bar{x} \subseteq \operatorname{ran}\left(f_{*}\right)$, so $f_{*}^{-1}(\bar{x}) \in \bar{x} / E_{k}^{\mathfrak{n}}$ and $f_{*}^{-1}(\bar{x}) \subseteq Y_{\mathfrak{m}}$ and, by $(*)_{2.6}$ (vii), we can replace $\bar{x}$ by $f_{*}^{-1}(\bar{x})$. (b), (c) are clear.]
$(*)_{2.7 .3}$ (a) $\mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}} \subseteq \mathcal{A}_{\mathfrak{s}}^{\mathfrak{n}}$, let $\mathcal{A}_{\mathfrak{s}}^{1}=\mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}}$, recalling 3.5 11;
(b) let $\mathcal{A}_{\mathfrak{s}}^{2}=\left\{\bar{b}^{\left[f_{*}^{-1}\right]}: \bar{b} \in \mathcal{A}_{\mathfrak{s}}^{1}\right.$ and $\left.\operatorname{dom}(\bar{b}) \subseteq \operatorname{dom}\left(f_{*}\right)\right\}$, where for $\bar{b}=\left(b_{y}\right.$ : $\left.y \in Z_{1}\right)$ with $Z_{1} \subseteq \operatorname{dom}\left(f_{*}\right)$ and $Z_{2}=f_{*}\left[Z_{1}\right]$, where we let:

$$
\bar{b}^{\left[f_{*}^{-1}\right]}=\left(b_{f_{*}^{-1}(y)}: y \in Z_{2}\right)
$$

(c) $\mathcal{A}_{\mathfrak{s}}^{2} \subseteq\left\{\bar{b} \in \mathcal{A}_{\mathfrak{s}}^{2}: \operatorname{dom}(\bar{b}) \subseteq \operatorname{ran}\left(f_{*}\right)\right\}$
(d) recalling 3.5 (f), notice that for any function $h$ such that $\bar{b}^{[h]}$ is well-defined we have that if $\bar{b}^{[h]}=\bar{c}$, then the following happens:

$$
\operatorname{dom}(\bar{b}) \subseteq \operatorname{ran}(h) \text { and } \operatorname{dom}(\bar{c}) \subseteq \operatorname{dom}(h)
$$

$(*)_{2.7 .4}$ Let $\mathcal{A}^{\prime}$ be the set of $\bar{a}$ such that for some $\bar{a}_{1} \in \mathcal{A}_{\mathfrak{s}}^{1}$ and $\bar{a}_{2} \in \mathcal{A}_{\mathfrak{s}}^{2}$ and $u$ such that $\operatorname{supp}_{p}\left(\bar{a}_{1}+\bar{a}_{2}\right) \subseteq u \subseteq \operatorname{dom}\left(\bar{a}_{1}\right) \cup \operatorname{dom}\left(\bar{a}_{2}\right)$ we have that $\left(\bar{a}_{1}+\bar{a}_{2}\right) \upharpoonright u=\bar{a}$. In this case we call $\left(\bar{a}_{1}, \bar{a}_{2}, u\right)$ a witness for $\bar{a}$.
Now we crucially claim:
$(*)_{2.7 .5} \quad \mathcal{A}_{\mathfrak{s}}^{\mathfrak{n}} \subseteq \mathcal{A}^{\prime}$.
Why $(*)_{2.7 .5}$ ? Obviously $\mathcal{A}^{\prime}$ satisfies 3.511 (a) and 3.511 (b) is a definition. By 3.5 (11) (g) it suffices to prove that $\mathcal{A}^{\prime}$ satisfies (c)-(f) from 3.5) 11).
$(*)_{2.7 .5 .1} \mathcal{A}^{\prime}$ satisfies Clause 3.5 11)(c).
Let $\mathbf{y}=\left(\bar{y}^{i}: i<i_{*}\right) \in\left(\bar{x} / E_{k}^{\mathfrak{n}}\right)^{i_{*}}, \bar{r} \in \mathbb{Q}^{\mathbf{y}}$ and $\bar{a}=\bar{a}_{(\mathbf{y}, \bar{r})}$ be as there. Recall that abusing notation we treat $\mathbf{y}$ as a set. Let:

$$
\begin{gathered}
\mathbf{y}_{1}=\left\{\bar{y}^{i}: i<i_{*}, \bar{y}^{i} \subseteq Y_{\mathfrak{m}}\right\} \\
\mathbf{y}_{2}=\left\{\bar{y}^{i}: i<i_{*}, \bar{y}^{i} \nsubseteq Y_{\mathfrak{m}}\left(\text { so } \bar{y}^{i} \subseteq \operatorname{ran}\left(f_{*}\right)\right)\right\} .
\end{gathered}
$$

Easily we have that $\mathbf{y}$ is the disjoint union of $\mathbf{y}_{1}$ and $\mathbf{y}_{2}$ and we have:

$$
\bar{a}_{(\mathbf{y}, \bar{r})}=\bar{a}_{\left(\mathbf{y}_{1}, \bar{r} \upharpoonright \mathbf{y}_{1}\right)}+\bar{a}_{\left(\mathbf{y}_{2}, \bar{r} \upharpoonright \mathbf{y}_{2}\right)}
$$

provided that we show that $\bar{a}_{2}=\bar{a}_{\left(\mathbf{y}_{2}, \bar{r} \backslash \mathbf{y}_{2}\right)} \in \mathcal{A}_{\mathfrak{s}}^{2}\left(\right.$ as $\bar{a}_{1}=\bar{a}_{\left(\mathbf{y}_{1}, \bar{r} \backslash \mathbf{y}_{1}\right)} \in \mathcal{A}_{\mathfrak{s}}^{1}$ is obvious by $(*)_{2.6}$ (viii)). We do this. Let $\mathbf{y}_{2}^{\prime}=\left\{f_{*}^{-1}(\bar{y}): \bar{y} \in \mathbf{y}_{2}\right\}$. Now, if $\bar{y} \in \mathbf{y}_{2}$, then $f_{*}^{-1}(\bar{y})=f_{\bar{g} \cap(g)}^{-1}(\bar{y}) \in \bar{x} / E_{k}^{\mathfrak{n}} \cap \operatorname{seq}_{k}\left(Y_{\mathfrak{m}}\right) \subseteq \bar{x} / E_{k}^{\mathfrak{m}}$. Why? First of all $f_{*}^{-1}(\bar{y})=$ $f_{\bar{g} \frown(g)}^{-1}(\bar{y})$, by the choice of $\bar{g} \frown(g)$. Secondly, $f_{\bar{g} \frown(g)}^{-1}(\bar{y}) \in \bar{x} / E_{k}^{\mathfrak{n}}$ as $\bar{y} \subseteq f_{*}\left[u_{*}\right]$, $\bar{y} \notin Y_{\mathfrak{m}}$ and $\bar{y} / E_{k}^{\mathfrak{n}}=f_{*}^{-1}(\bar{y}) / E_{k}^{\mathfrak{n}}$, by $(*)_{2.6}($ vii $)$. Thirdly, $f_{\bar{g} \subset(g)}^{-1}(\bar{y}) \in Y_{\mathfrak{m}}$, by the choice of $f_{\bar{g} \frown(g)}$. Thus, $f_{\bar{g} \frown(g)}^{-1}(\bar{y}) \in \bar{x} / E_{k}^{\mathfrak{n}} \cap Y_{\mathfrak{m}}$, and, by $(*)_{2.6}$ (viii) we have that
$\bar{x} / E_{k}^{\mathfrak{n}} \cap Y_{\mathfrak{m}} \subseteq \bar{x} / E_{k}^{\mathfrak{m}}$. Let now $\bar{r}_{2}^{\prime}=\left(r_{(2, \bar{y})}^{\prime}: \bar{y} \in \mathbf{y}_{2}^{\prime}\right)$, where $r_{(2, \bar{y})}^{\prime}=r_{\left(2, f_{*}(\bar{y})\right)}$. Also, let $\bar{a}_{2}^{\prime}=\left(a_{(2, y)}^{\prime}: y \in \operatorname{set}\left(\mathbf{y}_{2}^{\prime}\right)\right)$, where for $y \in \operatorname{set}\left(\mathbf{y}_{2}^{\prime}\right)$, we let:

$$
a_{(2, y)}^{\prime}=\sum\left\{r_{(2, \bar{y})}^{\prime} q_{\ell}: \bar{y} \in \mathbf{y}_{2}^{\prime} \text { and } y_{\ell}=y\right\}
$$

As $\mathbf{y}_{2}^{\prime} \subseteq \bar{x} / E_{k}^{\mathfrak{m}}$ and $\mathfrak{m}$ satisfies 3.511 (c), easily $\bar{a}_{2}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}}=\mathcal{A}_{\mathfrak{s}}^{1}$. Also, easily $y \in$ $\operatorname{set}\left(\mathbf{y}_{2}^{\prime}\right)$ implies $a_{(2, y)}^{\prime}=a_{\left(2, f_{*}(y)\right)}\left(\right.$ recall that $\left.r_{(2, \bar{y})}^{\prime}=r_{\left(2, f_{*}(\bar{y})\right)}\right)$ and so $\left(\bar{a}_{2}^{\prime}\right)^{\left[f_{*}^{-1}\right]}=$ $\bar{a}_{2}$. Thus, $\bar{a}_{2} \in \mathcal{A}_{\mathfrak{s}}^{2}$. Now, $\mathbf{y}_{2}^{\prime}, \bar{r}_{2}^{\prime}$ witness that $\bar{a}_{2}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{1}$ and so by the definition of $\mathcal{A}_{\mathfrak{s}}^{2}$ we are done. This concludes the proof of $(*)_{2.7 .5 .1}$.
$(*)_{2.7 .5 .2} \mathcal{A}^{\prime}$ satisfies Clause 3.5 (11)(d).
This is obvious by the definition of $\mathcal{A}^{\prime}$.
$(*)_{2.7 .5 .3} \mathcal{A}^{\prime}$ satisfies Clause 3.5 11) (e).
Let $\bar{a}, \bar{b} \in \mathcal{A}^{\prime}$ and let $\left(\bar{a}_{1}, \bar{a}_{2}, u\right)$ be a witness for $\bar{a}$ and $\left(\bar{b}_{1}, \bar{b}_{2}, v\right)$ be a witness for $\bar{b}$, now $\left(\bar{a}_{1}+\bar{a}_{2}, \bar{b}_{1}+\bar{b}_{2}, u \cup v\right)$ is a witness for $\bar{a}+\bar{b}$. Hence, $\bar{c}=\bar{a}+\bar{b} \in \mathcal{A}^{\prime}$.
$(*)_{2.7 .5 .4} \mathcal{A}^{\prime}$ satisfies Clause 3.5 11)(f).
Let $\bar{h} \in I^{\mathfrak{n}}, Z_{1} \subseteq \operatorname{dom}\left(f_{\bar{h}}\right), Z_{2}=f_{\bar{h}}\left[Z_{1}\right]$ and $\operatorname{dom}(\bar{a}) \subseteq Z_{2}$. We shall prove that $\bar{a}^{\left[f_{\bar{n}}\right]} \in \mathcal{A}^{\prime}$, where $\bar{a} \in \mathcal{A}^{\prime}$ and $\left(\bar{a}_{1}, \bar{a}_{2}, u\right)$ is a witness of this.
Case 1. $u \nsubseteq Y_{\mathfrak{m}}$ and $u \nsubseteq \operatorname{ran}\left(f_{*}\right)$.
In this case there is no such $\bar{h}$.
Case 2. $u \nsubseteq Y_{\mathfrak{m}}$ and $u \subseteq \operatorname{ran}\left(f_{*}\right)$.
Notice that $u \nsubseteq Y_{\mathfrak{m}}$, so there is $y \in u \backslash Y_{\mathfrak{m}}$. Now, $y \in u \subseteq \operatorname{dom}\left(f_{*}\right)$. But we have:

$$
\begin{gathered}
\bar{h} \in I^{\mathfrak{m}} \Rightarrow \operatorname{dom}\left(f_{\bar{h}}\right) \subseteq Y_{\mathfrak{m}} \Rightarrow y \notin \operatorname{dom}\left(f_{\bar{h}}\right), \\
\bar{h}=\bar{g}^{\frown}(g) \Rightarrow \operatorname{dom}\left(f_{\bar{h}}\right)=u_{*} \Rightarrow y \notin \operatorname{dom}\left(f_{\bar{h}}\right),
\end{gathered}
$$

so necessarily $\bar{h}=\left(\bar{g}^{-1}\right)^{\frown}\left(g^{-1}\right)$ and $f_{\bar{h}}=f_{*}^{-1}$. Now:
$(\cdot)$ W.l.o.g. $\operatorname{dom}\left(\bar{a}_{1}\right) \subseteq \operatorname{ran}\left(f_{\bar{g}}\right)$.
[Why? If $z \in \operatorname{dom}\left(\bar{a}_{1}\right) \backslash \operatorname{ran}\left(f_{\bar{g}}\right)$, then $z \notin u$ so $z \notin \operatorname{supp}_{p}(\bar{a})$ and $z \notin \operatorname{dom}\left(\bar{a}_{2}\right)$, hence $a_{z}=a_{(1, z)} \in \mathbb{Q}_{p}$. Thus, $\bar{a}_{1}^{*}=\bar{a}_{1} \upharpoonright\left(\operatorname{dom}\left(\bar{a}_{1}\right) \cap \operatorname{ran}\left(f_{\bar{g}}\right)\right) \in \mathcal{A}_{\mathfrak{s}}^{1}$ and $\left(\bar{a}_{1}+\bar{a}_{2}\right) \upharpoonright$ $u=\left(\bar{a}_{1}^{*}+\bar{a}_{2}\right) \upharpoonright u$, so we can replace $\bar{a}_{1}$ by $\bar{a}_{1}^{*}$, as $\mathfrak{m}$ satisfies clause (f).]
Let $\bar{a}_{1}^{\prime}=\bar{a}_{1}^{\left[f_{\bar{g}}\right]}=\bar{a}_{1}^{\left[f_{*}\right]}$, this is well-defined, it belongs to $\mathcal{A}_{\mathfrak{s}}^{1}$ and has domain $\subseteq$ $\operatorname{dom}\left(f_{*}\right)$. Also, $\operatorname{dom}\left(\bar{a}_{2}\right) \subseteq \operatorname{ran}\left(f_{*}\right)$ and $\bar{a}_{2} \in \mathcal{A}_{\mathfrak{s}}^{2}$, hence $\bar{a}_{2}^{\prime}=a_{2}^{\left[f_{*}\right]} \in \mathcal{A}_{\mathfrak{s}}^{1}$ and has domain $\subseteq \operatorname{dom}\left(f_{*}\right)$. By 3.511 (e) and the above we have that $\bar{a}^{\prime}=\bar{a}_{1}^{\prime}+\bar{a}_{2}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{1}$. Also, $\operatorname{supp}_{p}\left(\bar{a}^{\prime}\right) \subseteq f_{*}^{-1}[u] \subseteq \operatorname{dom}\left(\bar{a}_{1}^{\prime}+\bar{a}_{2}^{\prime}\right)$, hence $\bar{a}^{\prime} \upharpoonright f_{*}^{-1}[u] \in \mathcal{A}_{\mathfrak{s}}^{1}$. Hence:

$$
\begin{aligned}
\bar{a}^{\left[f_{\bar{h}}\right]} & =\bar{a}^{\left[f_{*}\right]} \\
& =\left(\left(\bar{a}_{1}+\bar{a}_{2}\right) \upharpoonright u\right)^{\left[f_{*}^{-1}\right]} \\
& =\left(\bar{a}_{1}+\bar{a}_{2}\right)^{\left[f_{*}\right]} \upharpoonright f_{*}^{-1}[u] \\
& =\left(\bar{a}_{1}^{\left[f_{*}\right]}+\bar{a}_{2}^{\left[f_{*}\right]}\right) \upharpoonright f_{*}^{-1}[u] \\
& =\left(\bar{a}_{1}^{\prime}+\bar{a}_{2}^{\prime}\right) \upharpoonright f_{*}^{-1}[u] \\
& =\bar{a}^{\prime} \upharpoonright f_{*}^{-1}[u] \in \mathcal{A}_{\mathfrak{s}}^{1} .
\end{aligned}
$$

Case 3. $u \subseteq Y_{\mathfrak{m}}$ and $\bar{h}=f_{\bar{g} \bigcirc(g)}^{\mathfrak{n}}=f_{*}$.
In this case we have:
(.) W.l.o.g. $\operatorname{dom}\left(\bar{a}_{2}\right) \subseteq \operatorname{ran}\left(f_{\bar{g}}\right)$.
[Why? If $y \in \operatorname{dom}\left(\bar{a}_{2}\right) \backslash \operatorname{ran}\left(f_{\bar{g}}\right)$, then (recalling $\operatorname{dom}\left(\bar{a}_{2}\right) \backslash \operatorname{ran}\left(f_{\bar{g}}\right) \subseteq f_{*}\left[u_{*}\right] \backslash$ $\left.\operatorname{ran}\left(f_{\bar{g}}\right) \subseteq f_{*}\left[u_{*}\right] \backslash u\right)$ we have that $y \notin u$ so $y \notin \operatorname{supp}_{p}(\bar{a})$ and $y \notin \operatorname{dom}\left(\bar{a}_{1}\right)$, hence $a_{y}=a_{(2, y)} \in \mathbb{Q}_{p}$. Thus, by $3.511(\mathrm{~d}), \bar{a}_{2}^{*}=\bar{a}_{2} \upharpoonright\left(\operatorname{dom}\left(\bar{a}_{2}\right) \cap \operatorname{ran}\left(f_{\bar{g}}\right)\right) \in \mathcal{A}_{\mathfrak{s}}^{2}$ and
$\left(\bar{a}_{1}+\bar{a}_{2}\right) \upharpoonright u=\left(\bar{a}_{1}+\bar{a}_{2}^{*}\right) \upharpoonright u$, so we can replace $\bar{a}_{2}$ by $\bar{a}_{2}^{*}$, as $\mathfrak{m}$ satisfies clause (f).] Let $\bar{a}_{2}^{\prime}=\bar{a}_{2}^{\left[f_{\bar{g}}\right]}=\bar{a}_{2}^{\left[f_{*}\right]}$, this is well-defined, it belongs to $\mathcal{A}_{\mathfrak{s}}^{1}$ (by the definition of $\mathcal{A}_{\mathfrak{s}}^{2}$, recalling $\bar{a}_{2} \in \mathcal{A}_{\mathfrak{s}}^{2}$. Also, $\bar{a}_{2}^{\prime}$ has domain $\subseteq \operatorname{dom}\left(f_{*}\right)$. Now, as $\mathfrak{m} \in \mathrm{K}_{0}^{\text {bo }}(M)$, $f_{\bar{g}} \in I^{\mathfrak{m}}$ and $\bar{a}_{2}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{1}=\mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}}$, recalling 3.5 11) (e), we have $\bar{a}_{2}=\left(\bar{a}_{2}^{\prime}\right)^{\left[f_{\bar{g}}^{-1}\right]} \in \mathcal{A}_{\mathfrak{s}}^{1}$, so as $\mathfrak{m} \in \mathrm{K}_{0}^{\text {bo }}(M)$ we have $\bar{a}_{1}+\bar{a}_{2} \in \mathcal{A}_{\mathfrak{s}}^{1}$. Thus, as $\mathcal{A}_{\mathfrak{s}}^{1} \subseteq \mathcal{A}^{\prime}$, we are done.
Case 4. $u \subseteq Y_{\mathfrak{m}}$ and $\bar{h} \in I_{\mathfrak{m}}$.
Similar to Case 3.
Case 5. $u \subseteq Y_{\mathfrak{m}}$ and $\bar{h}=f_{\left(\bar{g}^{-1}\right)-\left(g^{-1}\right)}^{\mathfrak{n}}=f_{*}^{-1}$.
As $u \subseteq Y_{\mathfrak{m}}$ and $u \subseteq \operatorname{dom}\left(f_{\bar{h}}^{\mathfrak{n}}\right)=\operatorname{dom}\left(f_{*}^{-1}\right)=\operatorname{ran}\left(f_{*}\right)$, necessarily we have:

$$
u \subseteq Y_{\mathfrak{m}} \cap \operatorname{ran}\left(f_{*}\right)=\operatorname{ran}\left(f_{\bar{g}}\right) \quad\left(\operatorname{cf.}(*)_{2.2}(\mathrm{c})\right)
$$

As in earlier cases:
(.) W.l.o.g. $\operatorname{dom}\left(\bar{a}_{2}\right) \subseteq \operatorname{ran}\left(f_{\bar{g}}\right)$.

So we can finish as in Case 4.
Thus, indeed $\mathcal{A}_{\mathfrak{s}}^{\mathfrak{n}} \subseteq \mathcal{A}^{\prime}$, by $(\mathrm{g})$ of the definition of $\mathcal{A}_{\mathfrak{s}}^{\mathfrak{n}}$ in 3.5,11) and $(*)_{2.7 .5 .1^{-}}$ $(*)_{2.7 .5 .4}$. Hence, we finished proving $(*)_{2.7 .5}$.
$(*)_{2.7 .6}$ If $\bar{a} \in \mathcal{A}^{\prime}$, then $\operatorname{supp}_{p}(\bar{a})$ is not a singleton.
We prove $(*)_{2.7 .6}$. Let $\bar{a} \in \mathcal{A}^{\prime}$ and let $\left(\bar{a}_{1}, \bar{a}_{2}, u\right)$ be a witness of this. For $\ell=1,2$, let $\bar{a}_{\ell}^{\prime}=\bar{a}_{\ell} \upharpoonright \operatorname{supp}_{p}\left(\bar{a}_{\ell}\right)$, then, by $3.511(\mathrm{~d})$, we have that $\bar{a}_{1}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{1}=\mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}}$. Also, $\bar{a}_{2}^{*}=\bar{a}_{2}^{\left[f_{*}\right]} \in \mathcal{A}_{\mathfrak{s}}^{1}$, by the definition of $\mathcal{A}_{\mathfrak{s}}^{2}$, and so, as $\mathfrak{m} \in \mathrm{K}_{0}^{\text {bo }}(M), \bar{a}_{2}^{*} \upharpoonright\{y \in X:$ $\left.f_{*}(y) \in \operatorname{dom}\left(\bar{a}_{2}^{\prime}\right)\right\} \in \mathcal{A}_{\mathfrak{s}}^{1}$. Clearly we have the following:

$$
\begin{aligned}
\operatorname{dom}_{p}\left(a_{2}^{*}\right) & :=\left\{y \in \operatorname{dom}\left(\bar{a}_{2}^{*}\right): \bar{a}_{(2, y)}^{*} \notin \mathbb{Q}_{p}\right\} \\
& =\left\{y \in \operatorname{dom}\left(a_{2}^{*}\right): a_{\left(2, f_{*}(y)\right)}=a_{(2, y)} \notin \mathbb{Q}_{p}\right\} \\
& =\left\{f_{*}(y): y \in \operatorname{dom}_{p}\left(\bar{a}_{2}\right)=\left\{y \in \operatorname{dom}\left(\bar{a}_{2}^{*}\right): \bar{a}_{(2, y)} \notin \mathbb{Q}_{p}\right\}\right\}
\end{aligned}
$$

Thus, $\bar{a}_{2}^{*} \upharpoonright \operatorname{dom}_{p}\left(\bar{a}_{2}^{*}\right)=\left(\bar{a}_{2}^{\prime}\right)^{\left[f_{*}\right]}$. As $\bar{a}_{2}^{*}=\bar{a}_{2}^{\left[f_{*}\right]} \in \mathcal{A}_{\mathfrak{s}}^{1}$, recalling that $\mathcal{A}_{\mathfrak{s}}^{1}=\mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}}$, by $3.511(\mathrm{~d})$, we have that $\left(\bar{a}_{2}^{\prime}\right)^{\left[f_{*}\right]}=\bar{a}_{2}^{*} \upharpoonright \operatorname{dom}_{p}\left(\bar{a}_{2}^{*}\right) \in \mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}}$. Hence, by the definition of $\mathcal{A}_{\mathfrak{s}}^{2}$ (as $\bar{a}=\bar{b}^{\left[f_{*}\right]}$ iff $\bar{b}=\bar{a}^{\left[f_{*}^{-1}\right]}$ ), $\bar{a}_{2}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{2}$. So we have:
(a) if $y \in \operatorname{dom}\left(\bar{a}_{1}\right) \cap \operatorname{dom}\left(\bar{a}_{2}\right)$, then:
$(\cdot) y \notin \operatorname{supp}_{p}\left(\bar{a}_{1}\right)$ implies $y \in \operatorname{supp}_{p}\left(\bar{a}_{1}+\bar{a}_{2}\right)$ iff $y \in \operatorname{supp}_{p}\left(\bar{a}_{2}\right)$;
$(\cdot) y \notin \operatorname{supp}_{p}\left(\bar{a}_{2}\right)$ implies $y \in \operatorname{supp}_{p}\left(\bar{a}_{1}+\bar{a}_{2}\right)$ iff $y \in \operatorname{supp}_{p}\left(\bar{a}_{1}\right)$;
(b) if $y \in \operatorname{dom}\left(\bar{a}_{1}\right) \backslash \operatorname{dom}\left(\bar{a}_{2}\right)$, then $y \in \operatorname{supp}_{p}\left(\bar{a}_{1}\right)$ iff $y \in \operatorname{supp}_{p}\left(\bar{a}_{1}+\bar{a}_{2}\right)$;
(c) if $y \in \operatorname{dom}\left(\bar{a}_{2}\right) \backslash \operatorname{dom}\left(\bar{a}_{1}\right)$, then $y \in \operatorname{supp}_{p}\left(\bar{a}_{2}\right)$ iff $y \in \operatorname{supp}_{p}\left(\bar{a}_{1}+\bar{a}_{2}\right)$.

Hence:
$(*)_{2.7 .6 .1}$ W.l.o.g. $\bar{a}=\bar{a}_{1}+\bar{a}_{2}$ and $\bar{a}_{\ell}=\bar{a}_{\ell} \upharpoonright \operatorname{supp}_{p}\left(\bar{a}_{\ell}\right)$, for $\ell=1,2$.
[Why? Letting $u^{\prime}=\operatorname{dom}\left(\bar{a}_{1}^{\prime}\right) \cup \operatorname{dom}\left(\bar{a}_{2}^{\prime}\right)$, we have:
(a) $u^{\prime} \subseteq u$;
(b) $\operatorname{dom}\left(\bar{a}_{1}^{\prime}\right), \operatorname{dom}\left(\bar{a}_{2}^{\prime}\right) \subseteq u$;
(c) $\bar{a}_{1}^{\prime}+\bar{a}_{2}^{\prime} \upharpoonright \operatorname{supp}_{p}\left(\bar{a}_{1}^{\prime}+\bar{a}_{2}^{\prime}\right)=\bar{a}_{1}+\bar{a}_{2} \upharpoonright \operatorname{supp}_{p}\left(\bar{a}_{1}+\bar{a}_{2}\right)$.

So $(*)_{\text {2.7.6.1 }}$ holds indeed.]
With $(*)_{2.7 .6 .1}$ in mind, we now get back to the proof of $(*)_{2.7 .6}$.
Case A. $\operatorname{supp}_{p}\left(\bar{a}_{1}\right) \nsubseteq \operatorname{ran}\left(f_{\bar{g}}\right)$ and $\operatorname{supp}_{p}\left(\bar{a}_{2}\right) \nsubseteq \operatorname{ran}\left(f_{\bar{g}}\right)$.
As $\operatorname{supp}_{p}\left(\bar{a}_{1}\right) \nsubseteq \operatorname{ran}\left(f_{\bar{g}}\right)$ we can choose $y_{1} \in \operatorname{supp}_{p}\left(\bar{a}_{1}\right) \backslash \operatorname{ran}\left(f_{\bar{g}}\right)$, and similarly we can choose $y_{2} \in \operatorname{supp}_{p}\left(\bar{a}_{2}\right) \backslash \operatorname{ran}\left(f_{\bar{g}}\right)$. Now $\operatorname{dom}\left(\bar{a}_{1}\right) \subseteq Y_{\mathfrak{m}}$ and $\operatorname{dom}\left(\bar{a}_{2}\right) \subseteq f_{*}\left[Y_{\mathfrak{m}}\right]$,
hence $\operatorname{dom}\left(\bar{a}_{1}\right) \cap \operatorname{dom}\left(\bar{a}_{2}\right) \subseteq Y_{\mathfrak{m}} \cap f_{*}\left[Y_{\mathfrak{m}}\right]=\operatorname{ran}\left(f_{\bar{g}}\right)\left(\right.$ recall $(*)_{2.2}(\mathrm{c})$ ), so necessarily $y_{1} \notin \operatorname{dom}\left(\bar{a}_{2}\right)$ and $y_{2} \notin \operatorname{dom}\left(\bar{a}_{1}\right)$ (by the choice of $y_{1}$ and $y_{2}$ ). Hence, letting $\bar{a}=\left(a_{y}: y \in u\right)$ and recalling the definition of $\bar{a}=\bar{a}_{1}+\bar{a}_{2}$ from 3.5 11e we have:
(.) $y_{1} \in \operatorname{dom}\left(\bar{a}_{1}\right) \backslash \operatorname{dom}\left(\bar{a}_{2}\right)$, so $a_{y_{1}}=a_{\left(1, y_{1}\right)}$;
(.) $y_{2} \in \operatorname{dom}\left(\bar{a}_{2}\right) \backslash \operatorname{dom}\left(\bar{a}_{1}\right)$, so $a_{y_{2}}=a_{\left(2, y_{2}\right)}$.

But $a_{\left(1, y_{1}\right)}, a_{\left(2, y_{2}\right)} \notin \mathbb{Q}_{p}\left(\right.$ as $y_{\ell} \in \operatorname{supp}_{p}\left(\bar{a}_{\ell}\right)$, for $\left.\ell=1,2\right)$ and so $a_{y_{1}}, a_{y_{2}} \notin \mathbb{Q}_{p}$, and, as obviously $y_{1} \neq y_{2}$, we are done. This concludes the proof of Case A.
Case B. $\operatorname{supp}_{p}\left(\bar{a}_{2}\right) \subseteq \operatorname{ran}\left(f_{\bar{g}}\right)$, equivalently, by $(*)_{2.7 .6 .1}, \operatorname{dom}\left(\bar{a}_{2}\right) \subseteq \operatorname{ran}\left(f_{\bar{g}}\right)$.
Define $\mathbf{y}_{2}^{\prime}=\left\{f_{*}^{-1}(\bar{y}): \bar{y} \in \mathbf{y}_{2}\right\}$, where, recalling $\bar{x}$ is from $\mathfrak{s}$ (cf. (*) $)_{2.7 .0}$ ), we let:

$$
\mathbf{y}_{2}=\left\{\bar{y} \in \bar{x} / E_{k}^{\mathfrak{n}}: \bar{y} \nsubseteq Y_{\mathfrak{m}}\left(\text { so } \bar{y} \subseteq \operatorname{ran}\left(f_{*}\right)\right)\right\}
$$

Let now:

$$
\bar{a}_{2}^{\prime}=\left(a_{(2, y)}^{\prime}: y \in \operatorname{set}\left(\mathbf{y}_{2}^{\prime}\right)\right)
$$

where:

$$
y \in \operatorname{set}\left(\mathbf{y}_{2}^{\prime}\right) \Rightarrow a_{(2, y)}^{\prime}=a_{\left(2, f_{*}(y)\right)}
$$

Now, we have:
$\left({ }^{\prime}\right) \mathbf{y}_{2}^{\prime} \subseteq \bar{x} / E_{k}^{\mathfrak{m}}$;
$\left({ }_{2}\right) \bar{a}_{2}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{1}$;
( $\cdot 3$ ) $\left(\bar{a}_{2}^{\prime}\right)^{\left[f_{*}\right]}=\bar{a}_{2}$;
$\left({ }_{4}\right) \operatorname{dom}\left(\bar{a}_{2}^{\prime}\right) \subseteq \operatorname{dom}\left(f_{\bar{g}}\right)$;
$\left({ }_{5}\right) \bar{a}_{2} \in \mathcal{A}_{\mathfrak{5}}^{1}$.
[Why? Concerning $\left({ }_{1}\right)$, if $\bar{y}^{\prime} \in \mathbf{y}_{2}^{\prime}$, then by the choice of $\mathbf{y}_{2}^{\prime}$, there is $\bar{y} \in \mathbf{y}_{2}$ such that $f_{*}^{-1}(\bar{y})=\bar{y}^{\prime}$. Furthermore, by the choice of $\mathbf{y}_{2}$ we have $\bar{y} \in \bar{x} / E_{k}^{\mathfrak{n}}$ and $\bar{y} \nsubseteq Y_{\mathfrak{m}}$ (so $\left.\bar{y} \subseteq \operatorname{ran}\left(f_{*}\right)\right)$. By the definition of $E_{k}^{\mathfrak{n}}$ we have $\bar{y}^{\prime} \in \bar{x} / E_{k}^{\mathfrak{n}}$. Thus, by $(*)_{2.6}$ (viii), we have $\bar{y}^{\prime} \in \bar{x} / E_{k}^{\mathfrak{m}}$, so $\left(\cdot_{1}\right)$ holds indeed. Also, $\left(\cdot_{2}\right)$ is by $\left({ }_{1}\right)$ and $(\cdot 3)$ is because we defined $\bar{a}_{2}^{\prime}=\left(a_{(2, y)}^{\prime}: y \in \operatorname{set}\left(\mathbf{y}_{2}^{\prime}\right)\right)$. Moving to the remaining clauses, we have that $\left(\cdot_{4}\right)$ holds as $\operatorname{supp}\left(\bar{a}_{2}\right) \subseteq \operatorname{ran}\left(f_{\bar{g}}\right)$. Finally, concerning $\left({ }_{5}\right)$, recalling that $f_{\bar{q}} \subseteq f_{*}$, by $\left({ }_{3}\right)+\left(\cdot_{4}\right)$ we have that $\left(\bar{a}_{2}^{\prime}\right)^{\left[f_{\bar{g}}\right]}=\bar{a}_{2}$, and as $\bar{a}_{2}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{1}=\mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}}$, by 3.5 11 (e) we have $\bar{a}_{2} \in \mathcal{A}_{\mathfrak{s}}^{1}=\mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}}$.]

Let now $\bar{a}_{*}=\bar{a}_{1}+\bar{a}_{2}$, as each summand is in $\mathcal{A}_{\mathfrak{s}}^{1}$ (notice that the second summand is in $\mathcal{A}_{\mathfrak{s}}^{1}$ by $\left.\left(\cdot{ }_{6}\right)\right)$, then also $\bar{a}_{*} \in \mathcal{A}_{\mathfrak{s}}^{1}$, recalling that $\mathcal{A}_{\mathfrak{s}}^{1}=\mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}}$ and $\mathfrak{m}$ satisfies condition 3.5 8)(e). Also, clearly $\bar{a}=\bar{a}_{*}$, but the latter belonging to $\mathcal{A}_{\mathfrak{s}}^{1}$ we have that $\operatorname{supp}_{p}(\bar{a})$ is not a singleton, recalling that $\mathcal{A}_{\mathfrak{s}}^{1}=\mathcal{A}_{\mathfrak{s}}^{\mathfrak{m}}$ and $\mathfrak{m}$ satisfies 3.5 11.
Case C. $\operatorname{supp}_{p}\left(\bar{a}_{1}\right) \subseteq \operatorname{ran}\left(f_{\bar{g}}\right)$, equivalently, by $(*)_{2.7 .6 .1}, \operatorname{dom}\left(\bar{a}_{1}\right) \subseteq \operatorname{ran}\left(f_{\bar{g}}\right)$.
This case is similar to Case B. Recalling $\bar{x}$ is from $\mathfrak{s}\left(\mathrm{cf} .(*)_{2.7 .0}\right)$, let:

$$
\begin{gathered}
\mathbf{y}_{2}=\left\{\bar{y} \in \bar{x} / E_{k}^{\mathfrak{n}}: \bar{y} \nsubseteq Y_{\mathfrak{m}}\left(\text { so } \bar{y} \subseteq \operatorname{ran}\left(f_{*}\right)\right)\right\} . \\
\mathbf{y}_{2}^{\prime}=\left\{f_{*}^{-1}(\bar{y}): \bar{y} \in \mathbf{y}_{2}\right\} \\
\bar{a}_{2}^{\prime}=\left(a_{(2, y)}^{\prime}: y \in \operatorname{set}\left(\mathbf{y}_{2}^{\prime}\right)\right)
\end{gathered}
$$

where:

$$
y \in \operatorname{set}\left(\mathbf{y}_{2}^{\prime}\right) \Rightarrow a_{(2, y)}^{\prime}=a_{\left(2, f_{*}(y)\right)}
$$

Let now $Y_{1}=\operatorname{supp}_{p}\left(\bar{a}_{1}\right) \subseteq \operatorname{ran}\left(f_{\bar{g}}\right)$ and $Y_{1}^{\prime}=f_{\bar{g}}^{-1}\left(Y_{1}\right) \subseteq \operatorname{dom}\left(f_{\bar{g}}\right)$, then we let:
$\left(\cdot{ }_{a}\right) \bar{a}_{1}^{\prime}=\left(a_{(1, y)}^{\prime}: y \in Y_{1}^{\prime}\right)$, where:
$\left(\cdot{ }_{b}\right) a_{(1, y)}^{\prime}=a_{\left(1, f_{\bar{g}}(y)\right)}$;
$\left(\cdot{ }_{c}\right) Y_{2}=\operatorname{dom}\left(\bar{a}_{2}\right), Y_{2}^{\prime}=f_{*}^{-1}\left[Y_{2}\right]=f_{\bar{g}}^{-1}\left[Y_{2}\right]$;
$\left(\cdot{ }_{d}\right) \bar{a}_{2}^{\prime}=\left(a_{(2, y)}^{\prime}: y \in Y_{2}^{\prime}\right)$, where:
$\left(\cdot{ }_{e}\right) a_{(2, y)}^{\prime}=a_{\left(2, f_{*}(y)\right)}^{\prime}$.
Then:
$\left(\cdot{ }_{1}\right) \mathbf{y}_{2}^{\prime} \subseteq \bar{x} / E_{k}^{\mathfrak{m}}($ recall that $\mathfrak{s}=(p, k, \bar{x}, \bar{q})$ and 3.5 11( e$\left.)\right)$;
$\left({ }_{2}\right) \bar{a}_{2}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{1}$;
( $\cdot_{3}$ ) $\left(\bar{a}_{1}^{\prime}\right)^{\left[f_{*}^{-1}\right]}=\bar{a}_{1}$;
$(\cdot 4) \operatorname{dom}\left(\bar{a}_{1}^{\prime}\right) \subseteq \operatorname{dom}\left(f_{\bar{g}}\right)$;
$\left(\cdot{ }_{5}\right) \bar{a}_{1}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{1}$;
$\left.\left({ }_{6}\right)\left(\bar{a}_{2}^{\prime}\right)\right)^{\left[f_{*}^{-}\right]}=\bar{a}_{2}$.
Let now $\bar{a}_{*}=\bar{a}_{1}+\bar{a}_{2}$ and let $\bar{a}_{*}^{\prime}=\bar{a}_{1}^{\prime}+\bar{a}_{2}^{\prime}$, so that $\left(\bar{a}_{*}^{\prime}\right)^{\left[f_{*}^{-1}\right]}=\bar{a}_{*}$. As $\bar{a}_{1}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{1}$ by $\left(\cdot{ }_{5}\right)$ and $\bar{a}_{2}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{1}$ by $\left({ }_{2}\right)$, then by 3.58 (e), also $\bar{a}_{*}^{\prime}=\bar{a}_{1}^{\prime}+\bar{a}_{2}^{\prime} \in \mathcal{A}_{\mathfrak{s}}^{1}$, hence $\operatorname{supp}_{p}\left(\bar{a}_{*}^{\prime}\right)$ is not a singleton $\left(\right.$ as $\left.\mathfrak{m} \in \mathrm{K}_{1}^{\text {bo }}(M)\right)$ and so also $\operatorname{supp}_{p}\left(\bar{a}_{*}\right)$ is not a singleton.
So we finished proving $\left(*_{2.7 .6}\right)$, i.e., $\bar{a} \in \mathcal{A}^{\prime}$ implies that $\operatorname{supp}_{p}(\bar{a})$ is not a singleton. Thus, we also finished proving $\left(*_{2}\right.$, as by $\left(*_{2.7 .5}\right)$ we have $\bar{a} \in \mathcal{A}_{\mathfrak{s}}^{\mathfrak{n}} \Rightarrow \bar{a} \in \mathcal{A}^{\prime}$, and so by $\left(*_{2.7 .6}\right)$ we are done, i.e., we have verified that $\mathfrak{n}$ satisfies 3.5 11.
$(*)_{3}$ We can choose an $<_{\text {suc }}$-increasing sequence $\left(\mathfrak{m}_{\ell}: \ell<\omega\right)$ in $\mathrm{K}_{0}^{\mathrm{bo}}(M)$ whose limit $\mathfrak{m}$ is as wanted, i.e. $\mathfrak{m} \in \mathrm{K}_{2}^{\mathrm{bo}}(M)$.
We show this. We can find a list $\left(\bar{g}^{\ell}: \ell<\omega\right)$ of $\bigcup_{m<\omega} \mathcal{G}_{*}^{m}$ such that:
$(*)_{3.1} \quad$ (i) $\lg \left(\bar{g}^{\ell}\right) \leqslant \ell$;
(ii) if $\bar{g}^{\ell} \triangleleft \bar{g}^{k}$, then $\ell<k$;
(iii) $\lg \left(\bar{g}^{\ell}\right)=0$ iff $\ell=0$;
(iv) note that for $\ell<\lg (\bar{g}), g_{\ell}^{k} \neq\left(g_{\ell}^{k}\right)^{-1}$
(v) $\bar{g}^{2 \ell+2}=\left(\bar{g}^{2 \ell+1}\right)^{-1}$;
(vi) if $\lg \left(\bar{g}^{2 \ell+1}\right)>1$, then there is a unique $i<\ell$ such that:
$\left({ }_{1}\right) \bar{g}^{2 i+1} \triangleleft \bar{g}^{2 \ell+2}$;
(.2) $\bar{g}^{2 i+2} \triangleleft \bar{g}^{2 \ell+1}$;
$(\cdot 3) \lg \left(\bar{g}^{2 \ell+1}\right)=\lg \left(\bar{g}^{2 \ell+2}\right)=\lg \left(\bar{g}^{2 i+1}\right)+1=\lg \left(\bar{g}^{2 i+2}\right)+1$.
Why do we ask what we ask in $(*)_{3.1}$ ? Clause (i) is just for clarity. Clause (ii) is needed because defining $\mathfrak{m}_{k+1}$ we would like to ensure $\bar{g}_{k} \in I^{\mathfrak{m}_{k+1}}$, in the interesting case $\bar{g}_{k} \notin I^{\mathfrak{m}_{k}}$ but $\bar{g}^{\prime} \triangleleft \bar{g}_{k}$ implies $f_{\bar{g}^{\prime}} \subseteq f_{\bar{g}_{k}}$, so it makes sense to take care of $\bar{g}_{k}$ only after all the $\bar{g}^{\prime} \triangleleft \bar{g}_{k}$ have been taken care of, but this means $\bar{g}^{\prime} \triangleleft \bar{g}_{k}$ implies $\bar{g}^{\prime} \in I^{\mathfrak{m}_{k}}$. Concerning clause (vi), the point is that in $(*)_{2}$ we only took care of having $\operatorname{dom}\left(\bar{f}_{\bar{g}} \cap(g)\right)$ to be large enough, but not of $\operatorname{ran}\left(\bar{f}_{\bar{g}}\right.$ (g) $)$. But, by our bookkeeping, if $\bar{g}_{\ell}$ is not empty sequence, $\bar{g}_{\ell} \triangleleft \bar{g}_{k}$ and $\lg \left(\bar{g}_{\ell}\right)+1=\lg \left(\bar{g}_{k}\right)$, then $k$ is odd if and only if $\ell$ is even. Hence if $k$ is odd, then choosing $\bar{g}_{k}$ will increase the domain of $f_{\bar{g}_{k}}^{\mathfrak{m}_{k+1}}$ to include $Y_{\mathfrak{m}_{k}} \cap X_{\text {dom }\left(\bar{g}_{k}\right)} \quad\left(\mathrm{cf} \quad.\left(*_{2}\right)(\mathrm{d})\right.$ ), and if $\ell$ is odd, then choosing $\bar{g}_{\ell}$ will increase the domain of $f_{\bar{g}_{\ell}}^{\mathfrak{m}_{\ell+1}}$ to include $Y_{\mathfrak{m}_{\ell}} \cap X_{\text {dom }\left(\bar{g}_{\ell}\right)}$, but $Y_{\mathfrak{m}_{\ell}} \subseteq Y_{\mathfrak{m}_{k}}$, so always $Y_{\mathfrak{m}_{\ell}} \cap X_{\operatorname{dom}\left(\bar{g}_{\ell}\right)} \subseteq \operatorname{dom}\left(f_{\bar{g}_{k}}^{\mathfrak{m}_{k+1}}\right)$. Mutatis mutandi we have that $Y_{\mathfrak{m}_{\ell}} \cap X_{\operatorname{ran}\left(\bar{g}_{\ell}\right)} \subseteq \operatorname{ran}\left(f_{\bar{g}_{k}}^{\mathfrak{m}_{k+1}}\right)$. Clearly this suffices.
Now, by induction on $\ell<\omega$, we choose $\mathfrak{m}_{\ell} \in \mathrm{K}_{0}^{\text {bo }}$ such that $n\left(\mathfrak{m}_{\ell}\right) \leqslant \ell+1$ and $\mathfrak{m}_{\ell+1} \in \operatorname{suc}\left(\mathfrak{m}_{\ell}\right)$ or $\mathfrak{m}_{\ell+1}=\mathfrak{m}_{\ell}$. We proceed as follows:
$(*)_{3.2} \quad(\ell=0)$ use $(*)_{1}$;

$$
\begin{aligned}
& (\ell=k+1)\left(\cdot_{1}\right) \text { if } \bar{g}^{k+1} \in I^{\mathfrak{m}_{k}} \text {, then } \mathfrak{m}_{\ell}=\mathfrak{m}_{k}(\text { if this occurs, then } k \text { is odd }) ; \\
& \left(\cdot_{2}\right) \text { if } \bar{g}^{k+1} \notin I^{\mathfrak{m}_{k}}, \text { let } m_{k}=\lg \left(\bar{g}^{k+1}\right)-1 \text {, so } \bar{g}^{k+1} \upharpoonright m_{k} \in I^{\mathfrak{m}_{k}}, \\
& \text { and use }(*)_{2} \text { with the pair } n\left(\mathfrak{m}_{k}\right), \bar{g}^{2 k+1} \text { here standing for } \\
& n, \bar{g}^{\frown}(g) \text { there. }
\end{aligned}
$$

Clearly $\mathfrak{m}=\lim _{\ell<\omega}\left(\mathfrak{m}_{\ell}\right) \in \mathrm{K}_{1}^{\mathrm{bo}}(M)$. Notice that by $(*)_{3.1}$ we have:
$(*)_{3.3}$ if $\bar{g}^{k} \triangleleft \bar{g}^{\ell} \triangleleft \bar{g}^{m}$, then:
(i) $f_{\bar{g}^{k}} \subseteq f_{\overline{g^{e}}} \subseteq f_{\bar{g}^{m}}$;
(ii) $Y_{\mathfrak{m}_{k}} \cap X_{\operatorname{dom}\left(f_{\bar{g}^{k}}\right)} \subseteq \operatorname{dom}\left(f_{\bar{g}^{m}}\right)$;
(iii) $Y_{\mathfrak{m}_{k}} \cap X_{\operatorname{ran}\left(f_{\bar{g} k}\right)} \subseteq \operatorname{ran}\left(f_{f_{\bar{g}}}\right)$;
(iv) if $s \subseteq_{1} \operatorname{dom}\left(f_{\bar{g}^{k}}\right)$, then $\min \left(X_{s}^{\prime} \backslash Y_{\mathfrak{m}_{k}}\right) \in \operatorname{dom}\left(f_{\bar{g}^{m}}\right)\left(\operatorname{see}(*)_{2.3}(\mathrm{~B})(\mathrm{c})\left(\cdot_{1}\right)\right)$;
(v) if $s \subseteq_{1} \operatorname{ran}\left(f_{\bar{g}^{k}}\right)$, then $\min \left(X_{s}^{\prime} \backslash Y_{\mathfrak{m}_{k}}\right) \in \operatorname{ran}\left(f_{\bar{g}^{m}}\right)\left(\right.$ see $\left.(*)_{2.3}(\mathrm{~B})(\mathrm{c})(\cdot 2)\right)$.

Thus we are only left to show that $\mathfrak{m} \in \mathrm{K}_{1}^{\text {bo }}(M)$ is full, that this, that $\mathfrak{m}$ satisfies conditions (12), (13) from 3.6. For this notice:
(i) Def. 3.6 (12) holds by the definition of $\mathfrak{m}_{k+1} \in \operatorname{suc}_{\mathfrak{m}_{k}}$, recalling (*) $)_{3.3}$ (iv)(v);
(ii) Def. $\overline{3.6}(13)$ holds as the $\bar{g}^{\ell \prime}$ s list $\mathcal{G}_{*}$.

Corollary 3.9. $\mathrm{K}_{2}^{\mathrm{bo}}(M) \neq \emptyset$.
Proof. This is obvious by 3.8 simply comparing Def. 3.4 and Def. $3.5+3.6$,

## 4. Borel Completeness of Torsion-Free Abelian Groups

### 4.1. The Definition of the Groups $G_{(1, \mathcal{U})}$

Definition 4.1. Let $\mathrm{K}_{3}^{\mathrm{bo}}(M)$ be the class of $\mathfrak{m} \in \mathrm{K}_{2}^{\mathrm{bo}}(M)$ expanded with a sequence $\bar{p}=\bar{p}^{\mathfrak{m}}$ of prime numbers without repetitions such that we have the following:
(1) $\bar{p}=\left(p_{(e, \bar{q})}: e \in \operatorname{seq}_{n}(X) / E_{n}^{\mathfrak{m}}\right.$ for some $0<n<\omega$ and $\left.\bar{q} \in\left(\mathbb{Z}^{+}\right)^{n}\right)$;
(2) for every $\ell<n, p \nmid q_{\ell}$.

Fact 4.2. Clearly every element of $\mathfrak{m} \in \mathrm{K}_{2}^{\mathrm{bo}}(M)$ can be expanded to an element of $\mathfrak{m} \in \mathrm{K}_{3}^{\mathrm{bo}}(M)$, and, as we showed in 3.9, that $\mathrm{K}_{2}^{\mathrm{bo}}(M) \neq \emptyset$ we have $\mathrm{K}_{3}^{\mathrm{bo}}(M) \neq \emptyset$.

We try to give some intuition on the group $G_{1}=G_{1}[\mathfrak{m}]$ which we are about to introduce in 4.3. This group will be some sort of universal domain for our construction, and in fact all the $\mathrm{TFAB}_{\omega}$ 's which will be in the range of our Borel reduction from $\mathbf{K}_{2}^{\text {eq }}$ (cf. 3.2) to $\mathrm{TFAB}_{\omega}$ will be pure subgroups of this group $G_{1}$. The group $G_{1}$ naturally interpolates between $G_{0}=\bigoplus\{\mathbb{Z} x: x \in X\}$ and $G_{2}=$ $\bigoplus\{\mathbb{Q} x: x \in X\}$, which have respectively the minimal and the maximal amount of divisibility possible. Clearly, the groups $G_{0}$ and $G_{2}$ do not code anything of the universal countable model $M \in \mathbf{K}_{2}^{\text {eq }}$ (cf. 3.2). Thus, we want to find a subgroup $G_{0} \leqslant G_{1} \leqslant G_{2}$ which does encode $M$. We do this adding divisibility conditions to $G_{0}$ which depend on the relation $E_{n}^{\mathrm{m}}$ from 3.4. So the first step is that for every $a \in G_{0}^{+}$we choose a prime $p_{a}$ and require the following condition:

$$
G_{0} \models a=\sum_{\ell<k} q_{\ell} x_{\ell} \neq 0 \Rightarrow G_{1} \models p_{a}^{\infty} \mid a .
$$

However, we want the partial permutations $f_{\bar{g}}$ of $X$ from 3.4 to induce partial automorphisms $\hat{f}_{\bar{g}}^{1}$ of our desired group $G_{1}$, and so we naturally demand:

$$
\iota \in\{1,2\}, a_{\iota}=\sum_{\ell<k} q_{\ell} x_{\ell}^{\iota}, \bigwedge_{\ell<k} f_{\bar{g}}\left(x_{\ell}^{1}\right)=x_{\ell}^{2} \Rightarrow p_{a_{1}}=p_{a_{2}} .
$$

Formally, this translates into a choice of $p_{(e, \bar{q})}$ as in 4.1 where condition 4.1/2) is simply a useful technical requirement. We finally define our "universal" group $G_{1}$.
Definition 4.3. Let $\mathfrak{m} \in \mathrm{K}_{3}^{\mathrm{bo}}(M)$.
(1) Let $G_{2}=G_{2}[\mathfrak{m}]$ be $\bigoplus\{\mathbb{Q} x: x \in X\}$.
(2) Let $G_{0}=G_{0}[\mathfrak{m}]$ be the subgroup of $G_{2}$ generated by $X$, i.e. $\bigoplus\{\mathbb{Z} x: x \in X\}$.
(3) Let $G_{1}=G_{1}[\mathfrak{m}]$ be the subgroup of $G_{2}$ generated by:
(a) $G_{0}$;
(b) $p^{-m}\left(\sum_{\ell<n} q_{\ell} x_{\ell}\right)$, where:
(i) $0<m<\omega$;
(ii) $\bar{x}=\left(x_{\ell}: \ell<n\right) \in \operatorname{seq}_{n}(X), e=\bar{x} / E_{n}^{\mathfrak{m}}, n>0$;
(iii) $\bar{q}$ is as in 4.1;
(iv) $p=p_{(e, \bar{q})}$ (so a prime, recalling Definition 4.1);
(c) [follows] for every $a \in G_{1}$ there are $i_{*}<\omega$ and, for $i<i_{*}$, $k_{i}, \bar{x}_{i} \in$ $\operatorname{seq}_{k_{i}}(X), \bar{q}_{i} \in\left(\mathbb{Z}^{+}\right)^{k(i)}, e_{i}=\bar{x}_{i} / E_{k_{i}}^{\mathfrak{m}}, p_{i}=p_{\left(e_{i}, \bar{q}_{i}\right)}$ (hence $\bar{q}_{i}$ is as in 4.1), $m(i) \geqslant 0$ and $r^{i} \in \mathbb{Z}^{+}$such that the following condition holds:

$$
a=\sum\left\{p_{i}^{-m(i)} r^{i} q_{(i, \ell)} x_{(i, \ell)}: i<i_{*}, \ell<k_{i}\right\} .
$$

(4) For a prime $p$, let $G_{(1, p)}=\left\{a \in G_{1}: a\right.$ is divisible by $p^{m}$, for every $\left.0<m<\omega\right\}$ (notice that, by Observation 2.5. $G_{(1, p)}$ is always a pure subgroup of $G_{1}$ ).
(5) For $\mathcal{U} \subseteq M$, we let:

$$
G_{(1, \mathcal{U})}[\mathfrak{m}]=G_{(1, \mathcal{U})}[\mathfrak{m}(M)]=G_{(1, \mathcal{U})}=\left\langle y: y \in X_{u}, u \subseteq_{1} \mathcal{U}\right\rangle_{G_{1}}^{*}=\left\langle X_{\mathcal{U}}\right\rangle_{G_{1}}^{*} .
$$

The notation $\mathfrak{m}(M)$ is from the second line of Def. 3.4 and $X_{\mathcal{U}}$ is from 3.4 (3).
(6) For $f_{\bar{g}} \in \bar{f}^{\mathfrak{m}}$ (cf. Definition 3.4 (4)), let $\hat{f}_{\bar{g}}^{2}$ be the unique partial automorphism of $G_{2}$ which is induced by $f_{\bar{g}}$ (see 4.4(2)), explicitly: if $k<\omega$ and for every $\ell<k$ we have that $y_{\ell}^{1} \in \operatorname{dom}\left(f_{\bar{g}}\right), y_{\ell}^{2}=\bar{f}_{\bar{g}}\left(y_{\ell}^{1}\right), q_{\ell} \in \mathbb{Q}^{+}$, then:

$$
a=\sum_{\ell<k} q_{\ell} y_{\ell}^{1} \in G_{2} \Rightarrow \hat{f}_{\bar{g}}^{2}(a)=\sum_{\ell<k} q_{\ell} y_{\ell}^{2}
$$

(7) For $\ell \in\{0,1\}$ we let $\hat{f}_{\bar{g}}^{2} \upharpoonright G_{\ell}=\hat{f}_{\bar{g}}^{\ell}$ and $\hat{f}_{\bar{g}}=\hat{f}_{\bar{g}}^{1}$ (see 4.4 2)).
(8) For $i \in\{0,1,2\}, a=\sum_{\ell<m} q_{\ell} x_{\ell} \in G_{i}$, with $\left(x_{\ell}: \ell<k\right) \in \operatorname{seq}_{k}(X)$ and $q_{\ell} \in \mathbb{Q}^{+}$, let $\operatorname{supp}(a)=\left\{x_{\ell}: \ell<m\right\}$, i.e., when $a \in G_{i}^{+}, \operatorname{supp}(a) \subseteq_{\omega} X$ is the smallest subset of $X$ such that $a \in\langle\operatorname{supp}(a)\rangle_{G_{i}}^{*}$.
(9) For $p$ a prime and $a \in G_{2}^{+}$we define the $p$-support of $a$, denoted as $\operatorname{supp}_{p}(a)$, as: if $a=\sum\left\{q_{\ell} x_{\ell}: \ell<k\right\}$ with $\left(x_{\ell}: \ell<k\right) \in \operatorname{seq}_{k}(X)$ and $q_{\ell} \in \mathbb{Q}^{+}$, then:

$$
\operatorname{supp}_{p}(a)=\left\{x_{\ell}: \ell<k \text { and } q_{\ell} \notin \mathbb{Q}_{p}\right\},
$$

where we recall that $\mathbb{Q}_{p}$ was defined in 2.6.
Lemma 4.4. Let $\mathfrak{m} \in \mathrm{K}_{3}^{\text {bo }}$ and $\ell \in\{0,1,2\}$.
(1) $G_{\ell}[\mathfrak{m}] \in \mathrm{TFAB}$ and $\left|G_{\ell}[\mathfrak{m}]\right|=\aleph_{0}$.
(2) (a) $\hat{f}_{\bar{g}}^{2}$ is a partial automorphisms of $G_{2}[\mathfrak{m}]$ mapping $G_{0}[\mathfrak{m}]$ into itself;
(b) $\hat{f}_{\bar{g}}=\hat{f}_{\bar{g}}^{1}=\hat{f}_{\bar{g}}^{2} \upharpoonright G_{(1, \operatorname{dom}(\bar{g}))}\left(c f . \quad\right.$ Def. 4.3(5)(7)), the map $\hat{f}_{\bar{g}}$ is a welldefined partial automorphism of $G_{1}$, and $\operatorname{dom}\left(\hat{f}_{\bar{g}}\right)$ is a pure subgroup of $G_{1}[\mathfrak{m}]$, in fact $\operatorname{dom}\left(\hat{f}_{\bar{g}}\right)$ is the pure closure in $G_{1}$ of $\operatorname{dom}\left(\hat{f}_{\bar{g}}^{0}\right)$;
(c) $\hat{f}_{\bar{g}^{-1}}=\hat{f}_{\bar{g}}^{-1}$;
(d) $\bar{g}_{1} \subseteq \bar{g}_{2} \Rightarrow \hat{f}_{\bar{g}_{1}} \subseteq \hat{f}_{\bar{g}_{2}}$;
(e) $f_{\bar{g}} \subseteq \hat{f}_{\bar{g}}^{0} \subseteq \hat{f}_{\bar{g}}^{1} \subseteq \hat{f}_{\bar{g}}^{2}$.
(3) If $p=p_{(e, \bar{q})}, e \in \operatorname{seq}_{n}(X) / E_{n}^{\mathfrak{m}}, \bar{q}=\left(q_{\ell}: \ell<n\right)$ is as in 4.1, and $n \geqslant 1$, then:
(a) $\left\langle\sum_{\ell<n} p^{-m} q_{\ell} y_{\ell}: m<\omega, \bar{y} \in e\right\rangle_{G_{1}}^{*} \leqslant G_{(1, p)}$;
(b) $G_{1} \leqslant\left\langle\left\{p^{-m} \sum_{\ell<n} q_{\ell} y_{\ell}: m<\omega, \bar{y} \in e\right\} \cup \mathbb{Q}_{p} G_{0}\right\rangle_{G_{2}}$;
(c) if $a \in G_{1}$, then there are $k<\omega$, and, for $i<k, \bar{y}^{i} \in e, s_{i} \in \mathbb{Q}^{+}$s.t.:
(i) $a=\sum_{i<k} s_{i}\left(\sum_{\ell<n} q_{\ell} y_{\ell}^{i}\right) \bmod \left(\mathbb{Q}_{p} G_{0} \cap G_{1}\right)$;
(ii) for all $i<k, s_{i} \sum_{\ell<n} q_{\ell} y_{\ell}^{i} \notin \mathbb{Q}_{p} G_{0}$, and $\ell<n$ implies $s_{i} q_{\ell} y_{\ell}^{i} \notin \mathbb{Q}_{p} G_{0}$;
(iii) $s_{i} \sum\left\{q_{\ell}^{i} y_{\ell}^{i}: \ell<n\right\} \in G_{1}$.
(4) In 4.4(3) we may add: $\left(\bar{y}^{i}: i<i_{*}\right)$ is with no repetitions.

Proof. Item (1) is clear. Concerning item (2), clause (a) holds as $f_{\bar{g}}$ is a partial 1-to-1 function from $X$ to $X$; while for clause (b) it suffices to prove that given $\sum_{\ell<k} q_{\ell} y_{\ell}^{1}$ and $\sum_{\ell<k} q_{\ell} y_{\ell}^{2}$ as in Definition 4.3 6) we have that:

$$
\sum_{\ell<k} q_{\ell} y_{\ell}^{1} \in G_{1} \Rightarrow \sum_{\ell<k} q_{\ell} y_{\ell}^{2} \in G_{1}
$$

In order to verify this it suffices to consider the case in which $a:=\sum_{\ell<k} q_{\ell} y_{\ell}^{1}$ is one of the generators of $G_{1}$ from 4.3(3). Thus, to conclude it suffices to notice that $f_{\bar{g}}$ maps $\bar{y}^{1}=\left(y_{\ell}^{1}: \ell<k\right)$ to $\bar{y}^{2}=\left(y_{\ell}^{2}: \ell<k\right)$, hence $\bar{y}^{2} \in \bar{y}^{1} / E_{k}^{\mathrm{m}}$ and recall 4.3 3b). This shows $(2)(\mathrm{b})$. Finally, items (2)(c)-(e) are easy and so we omit details.
Concerning item (3), if $\bar{y} \in e$ and $0<m<\omega$, then $p^{-m} \sum_{\ell<k} q_{\ell} y_{\ell}$ is one of the generators of $G_{1}$, as this holds for every $0<m<\omega$, it follows that $\sum_{\ell<k} p^{-m} q_{\ell} y_{\ell} \in$ $G_{(1, p)}$, by the definition of $G_{(1, p)}$. As $G_{(1, p)}$ is a subgroup of $G_{1}$, for every $\bar{y} \in e$ we have that $\sum_{\ell<n} q_{\ell} y_{\ell} \in G_{(1, p)} \leqslant G_{1}$. Let $Z_{(e, \bar{q})}=\left\{\sum_{\ell<n} q_{\ell} y_{\ell}: \bar{y} \in e\right\} \subseteq G_{(1, p)}$, then $\left\langle Z_{(e, \bar{q})}\right\rangle_{G_{1}}^{*} \leqslant G_{(1, p)}$, because by Definition 4.3 4) we have that $G_{(1, p)}$ is a pure subgroup of $G_{1}$ (cf. Obs. 2.5). This proves (3)(a).
Concerning (3)(b)(c), assume:
$\left(*_{1}\right) a \in G_{1}^{+}$.
By 4.3(3)(c), we have:
$\left(*_{2}\right)$ As $a \in G_{1}$ we can find:
(a) $i_{*}<\omega$;
(b) for $i<i_{*}, e_{i}=\bar{x}_{i} / E_{k_{i}}, \bar{x}_{i} \in \operatorname{seq}_{k_{i}}(X), \bar{q}^{i}=\left(q_{\ell}^{i}: \ell<k_{i}\right) \in\left(\mathbb{Z}^{+}\right)^{k_{i}}$;
(c) $r^{i} \in \mathbb{Z}^{+}, \bar{y}^{i} \in e_{i}, b_{i}=\sum_{\ell<k_{i}} q_{\ell}^{i} y_{\ell}^{i} \in G_{0}$;
(d) $p_{i}=p_{\left(e_{i}, \bar{q}^{i}\right)}$;
(e) $a=\sum_{i<i_{*}} p_{i}^{-m(i)} r^{i} b_{i}$, where $m(i)<\omega$;
(f) $\left(b_{i}: i<i_{*}\right)$ is with no repetitions;
(g) $p_{i}^{-m(i)} r^{i} b_{i} \in G_{1}$.

Let now:
$\left(*_{3}\right) V=\left\{i<i_{*}: p_{i}=p=p_{(e, \bar{q})}\right.$ and $\left.p_{i}^{-m(i)} r^{i} b_{i} \notin \mathbb{Q}_{p} G_{0}\right\}$,
where we recall that the object $p_{(e, \bar{q})}$ is from the statement of lemma and in particular it is fixed. Notice also that if $i \in V$, then $(e, \bar{q})=\left(e_{i}, \bar{q}^{i}\right)$. Hence, we have:
$\left(*_{4}\right)$ (a) if $i \in i_{*} \backslash V$, then $p_{i}^{-m(i)} r^{i} b_{i} \in \mathbb{Q}_{p} G_{0} ;$
(b) $i \in V$ implies $\bar{y}^{i} \in e$ and $\bar{q}^{i}=\bar{q}$;
(c) if $i \in V$ and $\ell(1), \ell(2)<k$, then:

$$
p_{i}^{-m(i)} r^{i} q_{\ell(1)}^{i} \in \mathbb{Q}_{p} \Leftrightarrow p_{i}^{-m(i)} r^{i} q_{\ell(2)}^{i} \in \mathbb{Q}_{p} \Leftrightarrow p_{i}^{-m(i)} r^{i} b_{i} \in \mathbb{Q}_{p} G_{0}
$$

(d) if $i \in V$, then $p_{i}^{-m(i)} r^{i} b_{i} \notin \mathbb{Q}_{p} G_{0}$;
(e) if $i \in V$ and $\ell<k$, then $p_{i}^{-m(i)} r^{i} q_{\ell}^{i} y_{\ell}^{i} \notin \mathbb{Q}_{p} G_{0}$.
[Notice that in the first equivalence of $\left(*_{4}\right)(\mathrm{c})$ we use: $\ell<k \Rightarrow q_{\ell} \in \mathbb{Z}^{+}, p \nmid q_{\ell}$.]
By $\left(*_{4}\right)$ we have:
( $*_{5}$ ) (a) $a=\sum\left\{p_{i}^{-m(i)} r^{i} b_{i}: i \in V\right\} \bmod \left(\mathbb{Q}_{p} G_{0} \cap G_{1}\right)$; (b) $i \in V$ implies $p_{i}^{-m(i)} r^{i} b_{i} \notin \mathbb{Q}_{p} G_{0}$.

So, defining $s_{i}$ as $p^{-m(i)} r^{i}$, we are done proving (3)(b)(c). Finally, (4) is easy.
Fact 4.5. Assume that $\mathfrak{m} \in \mathrm{K}_{3}^{\mathrm{bo}}(M), \mathcal{U}, \mathcal{V} \subseteq M$ and $|\mathcal{U}|=|\mathcal{V}|=\aleph_{0}$. Suppose further that there is $h: M \upharpoonright \mathcal{U} \cong M \upharpoonright \mathcal{V}$. Then there is $\bar{g}=\left(g_{k}: k<\omega\right)$ such that:
(a) for every $k<\omega, g_{k} \in \mathcal{G}$ (cf. 3.2.(3));
(b) for every $k<\omega, g_{k} \subsetneq g_{k+1}$;
(c) $\bigcup_{k<\omega} g_{k}: M \upharpoonright \mathcal{U} \cong M \upharpoonright \mathcal{V}$.

Proof. Let $h: M \upharpoonright \mathcal{U} \cong M \upharpoonright \mathcal{V}$. We can choose an increasing sequence $\left(n_{k}: k<\omega\right)$ such that $g_{k}=h \cap\left(n_{k} \times n_{k}\right)$ (pedantically $g=\left(h \cap\left(n_{k} \times n_{k}\right), 1\right)$ recalling 3.2,3) is strictly increasing and $\bigcup_{k<\omega} g_{k}=h$.

As mentioned, $G_{1}$ will be some sort of universal domain for our construction. This is reflected by the fact that instead of varying $M \in \mathbf{K}^{\mathrm{eq}}$ in Definition 3.4 we fix $M$ to be the countable universal homogeneous model of $\mathbf{K}^{\text {eq }}$, and, for $\mathcal{U} \subseteq M$, we consider the substructure $M \upharpoonright \mathcal{U}$ and the group $G_{(1, \mathcal{U})}$. We intend to show:

$$
M \upharpoonright \mathcal{U} \cong M \upharpoonright \mathcal{V} \Leftrightarrow G_{(1, \mathcal{U})}[\mathfrak{m}] \cong G_{(1, \mathcal{V})}[\mathfrak{m}]
$$

The easy direction is course the left-to-right one, which we now establish:
Claim 4.6. Assume that $\mathfrak{m} \in \mathrm{K}_{3}^{\mathrm{bo}}(M), \mathcal{U}, \mathcal{V} \subseteq M$ and $|\mathcal{U}|=|\mathcal{V}|=\aleph_{0}$. Then:

$$
M \upharpoonright \mathcal{U} \cong M \upharpoonright \mathcal{V} \Rightarrow G_{(1, \mathcal{U})}[\mathfrak{m}] \cong G_{(1, \mathcal{V})}[\mathfrak{m}]
$$

Proof. Let $\left(g_{k}: k<\omega\right)$ be as in Fact 4.5, $s_{k}=\operatorname{dom}\left(g_{k}\right)$ and $t_{k}=\operatorname{ran}\left(g_{k}\right)$. Then:
(i) for $k<\omega, \bar{g}_{k}=\left(g_{\ell}: \ell \leqslant k\right)$, so $\bar{g}_{k} \in \mathcal{G}_{*}^{k+1}($ cf. 3.2.4 and 4.5 a) (b) $)$;
(ii) $\bigcup_{k<\omega} g_{k}: M \upharpoonright \mathcal{U} \cong M \upharpoonright \mathcal{V}$ (cf. 4.5) (c) ;
(iii) for every $k<\omega$ we have that $\bar{g}_{k} \in \mathcal{G}_{*}$ and so, by Definition 3.4 4,,$f_{\bar{g}_{k}} \in \bar{f}^{\mathrm{m}}$.

Notice also that by 3.49 we have:
( $\star_{1}$ ) (d) $\bigcup_{k<\omega} \operatorname{dom}\left(f_{\bar{g}_{k}}\right)=\bigcup_{k<\omega} X_{s_{k}}=X_{\mathcal{U}}$;
(e) $\bigcup_{k<\omega} \operatorname{ran}\left(f_{\bar{g}_{k}}\right)=\bigcup_{k<\omega} X_{h\left[s_{k}\right]}=X_{\mathcal{V}}$.

Hence, we have:
$\left(\star_{2}\right) \bigcup_{k<\omega} \hat{f}_{\bar{g}_{k}}$ is an isomorphism from $G_{(1, \mathcal{U})}$ onto $G_{(1, \mathcal{V})}$ (cf. Def. 4.3.5 (7)).
[Why? By 4.3 5) (6) 7), 4.4 2b and 3.4, 9).]

### 4.2. Analyzing Isomorphism

Our aim in this subsection is to prove the converse of Claim 4.6
Hypothesis 4.7. Throughout this subsection the following hypothesis holds:
(1) $\mathfrak{m} \in \mathrm{K}_{3}^{\mathrm{bo}}(M)$;
(2) $\mathcal{U}, \mathcal{V} \subseteq M$;
(3) $|\mathcal{U}|=\aleph_{0}=|\mathcal{V}|$;
(4) $\pi$ is an isomorphism from $G_{(1, \mathcal{U})}[\mathfrak{m}]$ onto $G_{(1, \mathcal{V})}[\mathfrak{m}]$.

Our aim in 4.8 and 4.9 below is to show that $\pi$ essentially comes from a bijection from $X_{\mathcal{U}}$ onto $X_{\mathcal{V}}$, which are respectively the bases of $G_{(1, \mathcal{U})}[\mathfrak{m}]$ and $G_{(1, \mathcal{V})}[\mathfrak{m}]$ (in the appropriate sense). At the bottom of this is the crucial algebraic condition 3.48 , which puts restrictions on the possible $p$-supports of certain members of $G_{1}$.

Lemma 4.8. Let $a \in G_{(1, \mathcal{U})}[\mathfrak{m}]$ and let $b=\pi(a)$.
(1) For a prime $p, a \in G_{(1, p)} \Leftrightarrow b \in G_{(1, p)}$;
(2) if $a=q x$, for some $q \in \mathbb{Q}^{+}$and $x \in X_{\mathcal{U}}$, then for some $y \in X_{\mathcal{V}}$ :
(a) $(x) E_{1}^{\mathfrak{m}}(y)$;
(b) $b \in \mathbb{Q} y$, i.e. there exist $m_{1}, m_{2} \in \mathbb{Z}^{+}$such that $m_{1} b=m_{2} y$.

Proof. Item (1) is obvious by Hypothesis 4.7,4). Notice now that:
$\left(*_{0}\right)$ It suffices to prove $(2)(\mathrm{b})$.
Why $\left(*_{0}\right)$ ? Suppose that $b=\frac{m_{2}}{m_{1}} y$ and let $e^{\prime}=(x) / E_{1}^{\mathfrak{m}}$ and $p^{\prime}=p_{\left(e^{\prime},(1)\right)}$, then $x \in G_{\left(1, p^{\prime}\right)}$, but $a=q x$ and $a \in G_{1}$, hence $a \in G_{\left(1, p^{\prime}\right)}$. Now, applying (1) with $\left(a, b, p^{\prime}\right)$ here standing for $(a, b, p)$ there, we get that $b \in G_{\left(1, p^{\prime}\right)}$. As $b=\frac{m_{2}}{m_{1}} y \in G_{1}$, we have that $y \in G_{\left(1, p^{\prime}\right)}$ and thus:
(.) $G_{1}\left|=\left(p^{\prime}\right)^{\infty}\right| x$ and $G_{1}=\left(p^{\prime}\right)^{\infty} \mid y$.

Now, letting $H_{\left(p^{\prime}, 0\right)}=\left\langle x / E_{1}^{\mathfrak{m}}\right\rangle_{G_{0}}$ and $H_{\left(p^{\prime}, 1\right)}=\left\langle x / E_{1}^{\mathfrak{m}}\right\rangle_{G_{1}}^{*}$ we have that:
$\left(*_{0.1}\right) \quad$ (i) $G_{0} / H_{\left(p^{\prime}, 0\right)}$ is canonically $\cong$ to the direct sum of $\left\langle\mathbb{Z} y: y \in X \backslash x / E_{1}^{\mathfrak{m}}\right\rangle$;
(ii) $H_{\left(p^{\prime}, 1\right)} \cap G_{0}=H_{\left(p^{\prime}, 0\right)}$;
(iii) $G_{1} / H_{\left(p^{\prime}, 1\right)}$ naturally extends $G_{0} / H_{\left(p^{\prime}, 0\right)}$;
(iv) no non-zero element of $G_{1} / H_{\left(p^{\prime}, 1\right)}$ is divisible by $\left(p^{\prime}\right)^{\infty}$.

Why $\left(*_{0.1}\right)$ ? Straightforward or see a detailed proof of a more complicated case in 5.15 2). This concludes the proof of $\left(*_{0}\right)$.

Coming back to the proof:
$\left(*_{1}\right)$ Let $n<\omega, \bar{y} \in \operatorname{seq}_{n}\left(X_{\mathcal{V}}\right)$ and $\bar{q} \in\left(\mathbb{Q}^{+}\right)^{n}$ be such that $b=\sum\left\{q_{\ell} y_{\ell}: \ell<n\right\}$.
Trivially, $n>0$, we shall show that $n=1$, i.e., that (2)(b) holds. To this extent:
$\left(*_{1.1}\right)$ Let $q_{*} \in \omega \backslash\{0\}$ be such that:
$\left({ }_{1}\right) b_{1}:=q_{*} b \in G_{0}[\mathfrak{m}]$;
$\left(\cdot 2_{2}\right) q_{*} q \in \mathbb{Z}$, and $q_{*} q_{\ell} \in \mathbb{Z}$, for all $\ell<n$;
$\left(\cdot_{3}\right)$ for every prime $p^{\prime}$ we have $p^{\prime} \mid\left(q_{*} q\right)$ implies $p^{\prime} \mid\left(q_{*} q_{\ell}\right)$, for all $\ell<n$.
Let $e=\bar{y} / E_{n}, q_{\ell}^{\prime}=q_{*} q_{\ell}$ and $\bar{q}^{\prime}=\left(q_{\ell}^{\prime}: \ell<n\right)$, so that $q_{*} q_{\ell} y_{\ell}=q_{\ell}^{\prime} y_{\ell}$ and $q_{\ell}^{\prime} \in \mathbb{Z}^{+}$. Let $p=p_{\left(e, \bar{q}^{\prime}\right)}$ and let $b_{1}=q_{*} b=\sum\left\{q_{\ell}^{\prime} y_{\ell}: \ell<n\right\}$. Notice that we have:
$\left(*_{2}\right) \bigwedge_{\ell<k} p \nmid q_{\ell}^{\prime}$ and, for every $\ell<k, q_{\ell}^{\prime} \in \mathbb{Z}^{+} \subseteq \mathbb{Q}_{p}$.
[Why? Because $p=p_{\left(e, \bar{q}^{\prime}\right)}$ has been chosen in 4.1 exactly in this manner.]
Then we have:
$\left(*_{3}\right)$
(i) $b \in G_{(1, p)}$;
(ii) $a \in G_{(1, p)}$;
(iii) if $m<\omega$, then $p^{-m} a \in G_{(1, p)} \leqslant G_{1}$.
[Why (i)? By the choice of $p$ we have that $b_{1} \in G_{(1, p)}$ (cf. Def. 4.3 (3) (4)) and so, as $G_{(1, p)}$ is pure in $G_{1}$ (cf. Observation 2.5), $b_{1}=q_{*} b$ and $q_{*} \in \mathbb{Z}$, we have $b \in G_{(1, p)}$ (cf. Observation 2.4. Why (ii)? By (1) and (i), recalling Hyp. 4.7(4). Lastly, (iii) is immediate: by the definition of $G_{1}$ and of $G_{(1, p)}$ (Definition 4.3 3) (4)).]
$\left(*_{4}\right)$ W.l.o.g. $a=q x \notin \mathbb{Q}_{p} G_{0}$ and $p a \in G_{0}$.

We prove $\left(*_{4}\right)$. Let $a^{\prime}=p^{-1} q_{*} a, b^{\prime}=p^{-1} q_{*} b$ and $q^{\prime}=p^{-1} q_{*}$. So by $\left(*_{3}\right)$ we have that $a^{\prime}, b^{\prime} \in G_{1}$ and of course $\pi\left(a^{\prime}\right)=b^{\prime}$. Now, by the choice of $b^{\prime}$ and $q_{*}$ (cf. in particular $\left.\left(*_{1.1}\right)\left(\cdot_{3}\right)\right)$ we have that $p b^{\prime} \in G_{(0, \mathcal{V})}$, hence $p a^{\prime}=\pi^{-1}\left(p b^{\prime}\right) \in$ $G_{(0, \mathcal{U})}$. Notice that $a^{\prime} \notin G_{(0, \mathcal{U})}$, as $a^{\prime} \notin \mathbb{Q}_{p} G_{0}$ because $b^{\prime} \notin \mathbb{Q}_{p} G_{0}$, since from (*2) above, $\bigwedge_{\ell<k} p \wedge q_{\ell}^{\prime}$. Noticing that $\left(a^{\prime}, b^{\prime}, q_{*}^{\prime}, b_{1}, p, \bar{q}^{\prime}\right)$ satisfies all the demands of $\left(a, b, q_{*}, b_{1}, p, \bar{q}^{\prime}\right)$ (including $\left(*_{3}\right)$ ), it follows that:
(*4.1) (a) replacing $(a, q, b)$ with $\left(a^{\prime}, q^{\prime}, b^{\prime}\right)$ we can assume that $a=q x \notin \mathbb{Q}_{p} G_{0}$;
(b) if $b^{\prime}$ belongs to $\mathbb{Q} y$ for some $y \in X_{\mathcal{V}}$, the the conclusion of (2) is satisfied.

This concludes the proof of $\left(*_{4}\right)$.
Now, by 4.4 (3), there are $k<\omega$, and, for $i<k, \bar{y}^{i} \in \bar{y} / E_{n}$ and $r_{i} \in \mathbb{Q}^{+}$such that:
$\left(*_{5}\right)$ (a) $q x=a=\sum_{i<k} r_{i}\left(\sum_{\ell<n} q_{\ell}^{\prime} y_{\ell}^{i}\right)=\sum_{i<k}\left(\sum_{\ell<n} r_{i} q_{\ell}^{\prime} y_{\ell}^{i}\right) \bmod \left(\mathbb{Q}_{p} G_{0} \cap G_{1}\right)$;
(b) $r_{i} \sum_{\ell<n} q_{\ell}^{\prime} y_{\ell}^{i} \in G_{1}$ and $r_{i} q_{\ell}^{\prime} \notin \mathbb{Q}_{p}$.

By $\left(*_{4}\right), a=q x \notin \mathbb{Q}_{p} G_{0}$, and so clearly $k>0$. It suffices to prove that $k=1$, which by $\left(*_{5}\right)$ implies that $n=1$, i.e., there is $y \in X_{\mathcal{V}}$ such that $b \in \mathbb{Q} y$. Why does it follow that $n=1$ ? As otherwise the LHS of $\left(*_{5}\right)$ (a) has $p$-support a singleton but the RHS of $\left(*_{5}\right)($ a) has $p$-support of size at least two, a contradiction.
So toward contradiction assume that $k \geqslant 2$. Recalling ( $*_{4}$ ) notice that:
$\left(*_{6}\right) q x=a=\sum_{\ell<n}\left(\sum_{i<k} r_{i} q_{\ell}^{\prime} y_{\ell}^{i}\right) \bmod \left(\mathbb{Q}_{p} G_{0} \cap G_{1}\right)$;
Now, let $Z=\left\{y_{\ell}^{i}: i<i_{*}, \ell<k\right\}$ and, for $y \in Z$, let:

$$
a_{y}=\sum\left\{r_{i} q_{\ell}^{\prime}: i<i_{*}, \ell<k, y_{\ell}^{i}=y\right\}
$$

So, by ( $*_{6}$ ) we have:
$\left(*_{7}\right) q x=\sum\left\{a_{y} y: y \in Z\right\} \bmod \left(\mathbb{Q}_{p} G_{0} \cap G_{1}\right)$.
Now, as for the sake of contradiction we are assuming that $k \geqslant 2$, recalling that by $\left(*_{2}\right)$ we have that $q_{\ell}^{\prime} \in \mathbb{Z}^{+} \subseteq \mathbb{Q}_{p}$, by 3.4 8), we have the following:
$\left(*_{8}\right) \operatorname{supp}_{p}\left(\sum_{y \in Y} a_{y} y\right)=\left\{y \in Y: a_{y} \notin \mathbb{Q}_{p}\right\}$ is not a singleton.
Now recall that, by $\left(*_{4}\right), q x=a \notin \mathbb{Q}_{p} G_{0}$, hence $\operatorname{supp}_{p}(q x)=\{x\}$, so it is a singleton. By $\left(*_{8}\right)$, the RHS of $\left(*_{7}\right)$ has a non-singleton $p$-support whereas the LHS of $\left(*_{7}\right)$ has $p$-support a singleton, a contradiction. Hence, we are done proving (2).

Conclusion 4.9. (1) There is a sequence $\left(q_{x}^{1}: x \in X_{\mathcal{U}}\right)$ of non-zero rationals and a function $\pi_{1}: X_{\mathcal{U}} \rightarrow X_{\mathcal{V}}$ such that for every $x \in X_{\mathcal{U}}$ we have that:

$$
\pi(x)=q_{x}^{1}\left(\pi_{1}(x)\right) \quad \text { and } \quad \pi_{1}(x) \in x / E_{1}^{\mathfrak{m}}
$$

(2) There is a sequence $\left(q_{x}^{2}: x \in X_{\mathcal{V}}\right)$ of non-zero rationals and a function $\pi_{2}$ : $X_{\mathcal{V}} \rightarrow X_{\mathcal{U}}$ such that:

$$
\pi^{-1}(x)=q_{x}^{2}\left(\pi_{2}(x)\right)
$$

(3) (i) $\pi_{2} \circ \pi_{1}: X_{\mathcal{U}} \rightarrow X_{\mathcal{U}}=i d_{\mathcal{U}}$;
(ii) $\pi_{1} \circ \pi_{2}: X_{\mathcal{V}} \rightarrow X_{\mathcal{V}}=i d_{\mathcal{V}}$;
(iii) $\pi_{1}: X_{\mathcal{U}} \rightarrow X_{\mathcal{V}}$ is a bijection.

Proof. (1) is by 4.8, we elaborate. To this extent, let $R=\{(x, y): x, y \in$ $X$ and $\left.\pi(x) \in \mathbb{Q}^{+} y\right\}$. Now, we have:
$\left(*_{1}\right)$ For all $x \in X_{\mathcal{U}}$ there is $y \in X_{\mathcal{V}}$ such that $R(x, y)$.
[Why? By 4.8 2b] there is $y \in X_{\mathcal{V}}$ such that $\pi(x) \in \mathbb{Q} y$, as $\pi$ is an automorphism, necessarily $\pi(x) \neq 0$ and so $\pi(x) \in \mathbb{Q}^{+} y$.]
$\left(*_{2}\right)$ If $x \in X_{\mathcal{U}}$ and $\left(x, y_{1}\right),\left(x, y_{2}\right) \in R$, then $y_{1}=y_{2}$.
[Why? By the definition of $R$, there are $q_{1}, q_{2} \in \mathbb{Q}^{+}$such that $q_{1} y_{1}=\pi(x)=q_{2} y_{2}$. As $q_{1}, q_{2} \neq 0$, necessarily $q_{1}=q_{2}$ and $y_{1}=y_{2}$.]
Together, $R$ is the graph of a function which we call $\pi_{1}$. Lastly, $\pi_{1}(x) \in x / E_{1}^{\mathfrak{m}}$ by 4.82 a . Thus we proved (1).
(2) is by part (1) applied to $\pi^{-1}$ (and $\mathcal{V}, \mathcal{U}$ ).
(3) is by (1) and (2). Why? E.g., for (i) we have that:

$$
\pi^{-1} \circ \pi(x)=\pi^{-1}\left(q_{x}^{1}\left(\pi_{1}(x)\right)\right)=q_{\pi_{1}(x)}^{2} q_{x}^{1}\left(\pi_{2} \circ \pi_{1}(x)\right)=x
$$

which implies that $\pi_{2} \circ \pi_{1}(x)=x$. (ii) is similar and (iii) follows from (i) + (ii).
Our aim in the subsequent claims is to lift the 1-to-1 mapping from $X_{\mathcal{U}}$ onto $X_{\mathcal{U}}$ defined in 4.9 to an isomorphism from $M \upharpoonright \mathcal{U}$ onto $M \upharpoonright \mathcal{V}$. We recall that the equivalence relations $\mathfrak{E}_{i}^{M}$ (for $i \in\{0,1,2\}$ ) were defined in 3.2 . We intend to show that our mapping $\pi_{1}$ and $\pi_{1}^{-1}=\pi_{2}$ preserve them (and so also their negations). This is done introducing some auxiliary equivalence relations $\mathcal{E}_{i}$ (for $i \in\{0,1,2\}$ ) on $X$ which reflect (to some extent) the equivalence relations $\mathfrak{E}_{i}^{M}$ on $M$.
Definition 4.10. For $i<3$, let:

$$
\mathcal{E}_{i}=\left\{(x, y): \text { for some }(a, b) \in \mathfrak{E}_{i}^{M}, x \in X_{\{a\}}^{\prime} \text { and } y \in X_{\{b\}}^{\prime}\right\}
$$

where we recall that $\mathfrak{E}_{i}^{M}$ was introduced in 3.2.
Claim 4.11. (1) If $\left(y_{0}, y_{1}\right) \in\left(x_{0}, x_{1}\right) / E_{2}^{\mathfrak{m}}, x_{0}, x_{1}, y_{0}, y_{1} \in X$ and $i<3$, then:

$$
x_{0} \mathcal{E}_{i} x_{1} \Leftrightarrow y_{0} \mathcal{E}_{i} y_{1} .
$$

(2) The mapping $\pi_{1}$ from 4.9 preserves $\mathcal{E}_{i}$ and its negation, for all $i<3$.

Proof. (1) Suppose that $\left(y_{0}, y_{1}\right) \in\left(x_{0}, x_{1}\right) / E_{2}^{\mathfrak{m}}$. Then it is enough to prove:
$\left(\star_{1}\right)$ If $\bar{g} \in \mathcal{G}_{*}, f_{\bar{g}}\left(x_{\ell}\right)=y_{\ell}$, for $\ell=0,1$, then $x_{0} \mathcal{E}_{i} x_{1} \Leftrightarrow y_{0} \mathcal{E}_{i} y_{1}$.
For $\ell=0,1$, let $x_{\ell} \in X_{s_{\ell}}^{\prime}$, for $s_{\ell} \subseteq_{1} M$ and $y_{\ell} \in X_{t_{\ell}}^{\prime}$, for $t_{\ell} \subseteq_{1} M$. Now, as $f_{\bar{g}}\left(x_{\ell}\right)=y_{\ell}$, by $3.4(4)(\mathrm{d})$ we have that $\bar{g}\left[s_{\ell}\right]=t_{\ell}$. So $\bar{g}\left(s_{0}, s_{1}\right)=\left(t_{0}, t_{1}\right)$, and so, as $\bar{g} \in \mathcal{G}_{*}$ we have that $s_{0} \mathfrak{E}_{i} s_{1} \Leftrightarrow t_{0} \mathfrak{E}_{i}^{M} t_{1}$. This implies $x_{0} \mathcal{E}_{i} x_{1} \Leftrightarrow y_{0} \mathcal{E}_{i} y_{1}$.
Concerning (2). Using also $\pi_{2}, \mathcal{V}, \mathcal{U}$ it suffices to prove that for $x, y \in X_{\mathcal{U}}$ we have:

$$
x \mathcal{E}_{i} y \Rightarrow \pi_{1}(x) \mathcal{E}_{i} \pi_{1}(y)
$$

To this extent, suppose that $x \mathcal{E}_{i} y$ and let $s \subseteq_{1} \mathcal{U}$ be such that $x, y \in X_{s / \mathscr{E}_{i}^{M}}$ (as $s / \mathfrak{E}_{i}^{M} \subseteq M$, we are using 3.43 to give meaning to the expression $\left.X_{s / \mathbb{E}_{i}^{M}}\right)$. If $x=y$, then the conclusion is trivial, so we assume that $x \neq y$.
$\left(\star_{1.1}\right)$ Let $e=(x, y) / E_{2}^{\mathfrak{m}}, \bar{q}=(1,1)$ and $p=p_{(e, \bar{q})}$.
Now, we claim:
( $\star_{1.2}$ ) There is $0<m<\omega$ be such that $p^{-m} q_{x} \pi_{1}(x)+p^{-m} q_{y} \pi_{1}(y) \notin \mathbb{Q}_{p} G_{0} \cap G_{1}$.
[Why? First of all, as $q_{x}, q_{y} \in \mathbb{Q}^{+}$and $x \neq y \Rightarrow \pi_{1}(x) \neq \pi_{1}(y)$ and $\pi(x+y) \in G_{1}$, we have that $0 \neq a=q_{x} \pi_{1}(x)+q_{y} \pi_{1}(y) \in G_{1}$ and so we are done, recalling that by the definition of $\mathbb{Q}_{p}$ we have that for every $b \in G_{1}^{+}$there is $m<\omega$ s.t. $p^{-m} b \notin \mathbb{Q}_{p} G_{0}$.] So fix an $m<\omega$ as in $\left(\star_{1.2}\right)$. Now, by the choice of $p$, we have that $p^{-m}(x+y) \in$ $G_{(1, p)} \leqslant G_{1}$ and so we have that the following is satisfied:

$$
p^{-m} q_{x} \pi_{1}(x)+p^{-m} q_{y} \pi_{1}(y)=p^{-m} \pi(x)+p^{-m} \pi(y)=\pi\left(p^{-m}(x+y)\right) \in G_{(1, p)} .
$$

So, by 4.4 3 applied with $\left((x, y) / E_{2}^{\mathrm{m}},(1,1), p, p^{-m} q_{x} \pi_{1}(x)+p^{-m} q_{y} \pi_{1}(y)\right)$ standing for $\left(e, \overline{\bar{q}}, p_{(e, \bar{q})}, a\right)$ there, there are $\left(x_{j}, y_{j}\right) \in(x, y) / E_{2}^{\mathfrak{m}}$ and $r_{j} \in \mathbb{Q}^{+}$, for $j<j_{*}$, s.t.:
( $\star_{2}$ ) (a) $\left(\left(x_{j}, y_{j}\right): j<j_{*}\right)$ is with no repetitions;
(b) $p^{-m} q_{x} \pi_{1}(x)+p^{-m} q_{y} \pi_{1}(y)=\sum_{j<j_{*}} r_{j}\left(x_{j}+y_{j}\right) \bmod \left(\mathbb{Q}_{p} G_{0} \cap G_{1}\right)$.

Now, by (1), recalling $x \mathcal{E}_{i} y$, for $j<j_{*}$, there are $s_{j} \subseteq_{1} M$ such that $x_{j}, y_{j} \in X_{s_{j} / \mathbb{E}_{i}^{M}}$. Next, by $\left(\star_{1.2}\right)$, the LHS of $\left(\star_{2}\right)(\mathrm{b})$ is not in $\mathbb{Q}_{p} G_{0} \cap G_{1}$, so the same happens for the RHS of $\left(\star_{2}\right)(\mathrm{b})$, hence, necessarily, $\left\{s_{j} / \mathfrak{E}_{i}^{M}: j<j_{*}\right\} \neq \emptyset$ (i.e., $j_{*} \geqslant 1$ ), let $\left(t_{\ell} / \mathfrak{E}_{i}^{M}: \ell<\ell_{*}\right)$ list it without repetitions, with $t_{\ell} \in\left\{s_{j}: j<j_{*}\right\}$ for each $\ell<\ell_{*}$. Let then:

$$
u_{\ell}=\left\{j<j_{*}: s_{j} / \mathfrak{E}_{i}^{M}=t_{\ell} / \mathfrak{E}_{i}^{M}\right\} .
$$

So we have:
$\left(\star_{3}\right) p^{-m} q_{x} \pi_{1}(x)+p^{-m} q_{y} \pi_{1}(y)=\sum_{\ell<\ell_{*}} \sum_{j \in u_{\ell}} r_{j}\left(x_{j}+y_{j}\right) \bmod \left(\mathbb{Q}_{p} G_{0} \cap G_{1}\right)$.
Now, for $\ell<\ell_{*}$, let $c_{\ell}=\sum_{j \in u_{\ell}} r_{j}\left(x_{j}+y_{j}\right)$, then:
$\left(\star_{4}\right) p^{-m} q_{x} \pi_{1}(x)+p^{-m} q_{y} \pi_{1}(y)=\sum_{\ell<\ell_{*}} c_{\ell} \bmod \left(\mathbb{Q}_{p} G_{0} \cap G_{1}\right)$.
$\left(\star_{5}\right)\left(\operatorname{supp}_{p}\left(c_{\ell}\right): \ell<\ell_{*}\right)$ is a sequence of pairwise disjoint sets.
[Why? As $\operatorname{supp}\left(c_{\ell}\right) \subseteq X_{t_{\ell} / \mathfrak{E}_{i}^{M}}$, recalling the $t_{\ell} / \mathfrak{E}_{i}^{M}$ 's are with no repetitions.]
$\left(\star_{6}\right)$ If $c_{\ell} \notin \mathbb{Q}_{p} G_{0}$, then $\left|\operatorname{supp}_{p}\left(c_{\ell}\right)\right| \geqslant 2$.
[Why? Recall that $c_{\ell}=\sum_{j \in u_{\ell}} r_{j}\left(x_{j}+y_{j}\right)$ and let $Y_{\ell}=\bigcup\left\{\left\{x_{j}, y_{j}\right\}: j \in u_{\ell}\right\}$ and, for $z \in Y_{\ell}$, let $a_{z}=\sum\left\{r_{j}: j \in u_{\ell}, x_{j}=z\right\}+\sum\left\{r_{j}: j \in u_{\ell}, y_{j}=z\right\}$. Now we can apply 3.4 8 with $\left(p, 2,(x, y),\left(\left(x_{j}, y_{j}\right): j \in u_{\ell}\right),(1,1),\left(r_{j}: j \in u_{\ell}\right),\left(a_{z}: z \in Y_{\ell}\right)\right)$ here standing for $\left(p, k, \bar{x}, \mathbf{y}, \bar{r}, \bar{a}_{(\mathbf{y}, r)}\right)$ there and get $\left|\left\{z \in Y_{\ell}: a_{z} \notin \mathbb{Q}_{p}\right\}\right| \neq 1$. But this means that $\left|\operatorname{supp}_{p}\left(c_{\ell}\right)\right| \neq 1$, but $\left|\operatorname{supp}_{p}\left(c_{\ell}\right)\right| \neq 0$ as $c_{\ell} \notin \mathbb{Q}_{p} G_{0}$, hence $\left|\operatorname{supp}_{p}\left(c_{\ell}\right)\right| \geqslant 2$, as promised. This concludes the proof of $\left(\star_{6}\right)$.]
$\left(\star_{7}\right) V=\left\{\ell<\ell_{*}: c_{\ell} \notin \mathbb{Q}_{p} G_{0}\right\}$ has exactly one member.
[Why? If $V=\emptyset$, then the RHS of $\left(\star_{4}\right)$ is in $\mathbb{Q}_{p} G_{0}$ but not the LHS, recalling $\left(\star_{5}\right)$ and the choice of $m<\omega$ in $\left(\star_{1.2}\right)$, a contradiction. On the other hand, if $|V| \geqslant 2$, then the RHS of $\left(\star_{3}\right)$ has $p$-support of size $\sum_{\ell<\ell_{*}}\left|\operatorname{supp}_{p}\left(c_{\ell}\right)\right| \geqslant 2|V|>2$, but the $p$-support of the LHS of $\left(\star_{3}\right)$ has cardinality 2 , a contradiction.]
Let $k$ be the unique member of $V$, then we have the following:

$$
\begin{aligned}
\left\{\pi_{1}(x), \pi_{1}(y)\right\} & =\operatorname{supp}_{p}\left(p^{-m} q_{x} \pi_{1}(x)+p^{-m} q_{y} \pi_{1}(y)\right) \\
& =\operatorname{supp}_{p}\left(\sum_{\ell<\ell_{*}} c_{\ell}\right) \\
& =\operatorname{supp}_{p}\left(c_{k}\right) \subseteq X_{t_{k} / \mathfrak{E}_{i}^{M}} .
\end{aligned}
$$

So $\pi_{1}(x), \pi_{1}(y) \in X_{t_{k} / \mathscr{E}_{i}^{M}}$ and as $X_{t_{k} / \mathscr{E}_{i}^{M}}$ is an $\mathcal{E}_{i}$-equivalence class (by the definition of $\left.\mathcal{E}_{i}\right)$, then $\pi_{1}(x) \mathcal{E}_{i} \pi_{1}(y)$, as desired. This concludes the proof of the claim.

Claim 4.12. There is a bijection $h: \mathcal{U} \rightarrow \mathcal{V}$ preserving $\mathfrak{E}_{i}^{M}$ and $\neg \mathfrak{E}_{i}^{M}$, for all $i<3$.
Proof. By 4.11 22, we have:
$\left(*_{1}\right)$ If $x, y \in X_{\mathcal{U}}$ and $i<3$, then $x \mathcal{E}_{i} y \Leftrightarrow \pi_{1}(x) \mathcal{E}_{i} \pi_{1}(y)$.
Now apply $\left(*_{1}\right)$ for $i=2$ and recall that by 3.2 1
$\left(*_{2}\right) \exists s \subseteq_{1} \mathcal{U}\left(x, y \in X_{s}^{\prime}\right) \Leftrightarrow \exists t \subseteq_{1} \mathcal{V}\left(\pi_{1}(x), \pi_{1}(y) \in X_{t}^{\prime}\right)$.
Now, as $X_{\mathcal{U}}=\bigcup_{s \subseteq_{1} \mathcal{U}} X_{s}^{\prime}$ and $X_{\mathcal{V}}=\bigcup_{s \subseteq_{1} \mathcal{V}} X_{s}^{\prime}$, there is a function $\mathbf{h}_{1}$ from $\mathcal{U}$ into
$\mathcal{V}$ such that (not distinguishing $a \in \mathcal{U}$ with $\{a\} \subseteq_{1} \mathcal{U}$ ):
$\left(*_{3}\right)$ If $x \in X_{s}^{\prime}, s \subseteq_{1} \mathcal{U}$, then $\pi_{1}(x) \in X_{\mathbf{h}_{1}(s)}^{\prime}$.
As $\pi_{2}=\pi_{1}^{-1}$ and $\pi_{2}$ is a function from $X_{\mathcal{V}}$ onto $X_{\mathcal{U}}$ (cf. 4.9) we have that:
$\left(*_{4}\right) \mathbf{h}_{1}: \mathcal{U} \rightarrow \mathcal{V}$ is 1-to-1 and onto.

Finally, applying 4.11 2 to $i$ and recalling the definition of $\mathcal{E}_{i}$ we get:
$\left(*_{5}\right)$ For $i=0,1, a \neq b \in \mathcal{U}$ implies $a \mathfrak{E}_{i}^{M} b \Leftrightarrow \pi_{1}(a) \mathfrak{E}_{i}^{M} \pi_{1}(b)$.

Conclusion 4.13. $M \upharpoonright \mathcal{U}$ and $M \upharpoonright \mathcal{V}$ are isomorphic members of $\mathbf{K}^{\mathrm{eq}}$.
In a work in preparation (among other things) we intend to give a characterization of the automorphism groups of the groups $G_{(1, \mathcal{U})}$ that we construct above.

### 4.3. The Proof of the Main Theorem

Notice that in this subsection Hypothesis 4.7 is no longer assumed.
Conclusion 4.14. Let $\mathfrak{m}[M] \in \mathrm{K}_{3}^{\mathrm{bo}}, \mathcal{U}, \mathcal{V} \subseteq M$ and $|\mathcal{U}|=|\mathcal{V}|=\aleph_{0}$. Then:

$$
M \upharpoonright \mathcal{U} \cong M \upharpoonright \mathcal{V} \Leftrightarrow G_{(1, \mathcal{U})}[\mathfrak{m}] \cong G_{(1, \mathcal{V})}[\mathfrak{m}]
$$

Proof. If the LHS of $(\star)$ holds, then by 4.6 also the RHS of $(\star)$ holds. If the RHS of $(\star)$ holds, then the assumptions in 4.7 are fulfilled and thus 4.13 holds, and so the LHS of $(\star)$ holds.

Convention 4.15. In Fact 1.1 and Notation 1.8 (5) instead of considering structures with domain $\omega$ we could have considered structures with domain an infinite subset of $\omega$. We take the liberty of not distinguishing between these two variants. This happens most notably in the Proof of Main Theorem right below.

Recall:
Fact 4.16. The class $\mathbf{K}_{\omega}^{\mathrm{eq}}$ is Borel complete. In fact, there is a continuous map from $\mathrm{Graph}_{\omega}$ into $\mathbf{K}_{\omega}^{\mathrm{eq}}$ which preserves isomorphism and its negation.
Proof. See e.g. [12, pg. 295].
Proof of Main Theorem. Let $M$ be as in Hypothesis 3.2. Fix $\mathfrak{m} \in \mathrm{K}_{3}^{\mathrm{bo}}(M)$ (cf. Fact 4.2 and assume without loss of generality that $G_{1}[\mathfrak{m}]$ has set of elements $\omega$. For every $H \in \mathbf{K}_{\omega}^{\mathrm{eq}}$ we define $F[H]: H \rightarrow M$ by defining $F[H](n)$ by induction on $n<\omega$ as the minimal $k<\omega$ such that $\{(\ell, F[H](\ell)): \ell<n\} \cup\{(n, k)\}$ is an isomorphism from $H \upharpoonright(n+1)$ onto $M \upharpoonright(\{F[H](\ell): \ell<n\} \cup\{k\})$. The map $H \mapsto M \upharpoonright\{F[H](n): n<\omega\}$ is clearly continuous. We will show that the map $F^{\prime}: M \upharpoonright \mathcal{U} \mapsto G_{(1, \mathcal{U})}[\mathfrak{m}]$, for $\mathcal{U} \subseteq M$ infinite, is also continuous (cf. 4.15), thus concluding that the map $\mathbf{B}:=F^{\prime} \circ F: H \mapsto G_{(1,\{F[H](n): n<\omega\})}[\mathfrak{m}]$ is a continuous map from $\mathbf{K}_{\omega}^{\mathrm{eq}}$ into $\mathrm{TFAB}_{\omega}$ (cf. 4.15), so, by 4.14 and 4.16 , we are done.
In order to show that $F^{\prime}$ is continuous, first recall that $\mathfrak{m} \in \mathrm{K}_{3}^{\text {bo }}$ is fixed (cf. 4.1), and so in particular $\bar{p}$ is fixed. Now, given $a \in G_{1}[\mathfrak{m}]$, we have to compute from $\mathcal{U}$ whether $a \in G_{(1, \mathcal{U})}[\mathfrak{m}]$ or not. To this extent, let $a=\sum\left\{q_{\ell}^{a} x_{\ell}^{a}: \ell<n\right\}$ with the $x_{\ell}$ 's pairwise distinct and $q_{\ell} \in \mathbb{Q}^{+}$. Now, as by 3.4 3), $X_{\mathcal{U}}=\bigcup\left\{X_{s}: s \subseteq_{\omega} \mathcal{U}\right\}=$ $\bigcup\left\{X_{s}^{\prime}: s \subseteq_{1} \mathcal{U}\right\}$ and the latter is a partition of $X$, for every $\ell<n$, there is a unique finite $s_{\ell}^{a} \subseteq M$ such that the following conditions holds:

$$
a \in G_{(1, \mathcal{U})}[\mathfrak{m}] \Leftrightarrow \bigwedge_{\ell<n} s_{\ell}^{a} \subseteq \mathcal{U} .
$$

This suffices to show continuity of $F^{\prime}$, thus concluding the proof of the theorem.
Remark 4.17. We observe that in the context of the Proof of Main Theorem we can choose both $M$ and $\mathfrak{m}$ to be computable stuctures, in the sense of computable model theory, i.e., all the relations and functions of the structure are computable.

## 5. Completeness of Endorigid Torsion-Free Abelian Groups

The aim of this section is to show that deciding whether a group $G \in \operatorname{TFAB}_{\omega}$ is endorigid is a complete co-analytic problem. We do this by reducing a well-known problem to the endorigidity problem, namely the problem of deciding whether a tree with domain $\omega$ has an infinite branch, which is well-known to be complete coanalytic. So the idea here is to code a tree $T$ into a $\mathrm{TFAB}_{\omega} G[T]$. The way we code the tree $T$ is reminiscent of the coding used for the proof of the Main Theorem. Also in this case $X$ will be a basis of the group $G[T]$, and we will code an element $t \in T$ via a partial permutation $f_{t}$ of $X$. As in Section 4, the group $G[T]$ that we wish to construct will interpolate between between $G_{0}=\bigoplus\{\mathbb{Z} x: x \in X\}$ and $G_{2}=\bigoplus\{\mathbb{Q} x: x \in X\}$, via a set of tailored divisibility conditions which code the behaviour of the partial maps $f_{t}$ 's, which in turn code the elements of the tree $T$.

In 5.15 .9 we deal with the combinatorial part, then we will define the groups.
Hypothesis 5.1. Throughout this section the following hypothesis stands:
(1) $T=\left(T,<_{T}\right)$ is a rooted tree with $\omega$ levels and we denote by $\operatorname{lev}(t)$ the level of $t$;
(2) $T=\bigcup_{n<\omega} T_{n}, T_{n} \subseteq T_{n+1}$, and $t \in T_{n}$ implies that $\operatorname{lev}(t) \leqslant n$;
(3) $T_{0}=\emptyset, T_{n}$ is finite, and we let $T_{<n}=\bigcup_{\ell<n} T_{\ell}\left(\right.$ so $\left.T_{<(n+1)}=T_{n}\right)$;
(4) if $s<_{T} t \in T_{n+1}$, then $s \in T_{n}$;
(5) $T$ is countable.

Definition 5.2. Let $\mathrm{K}_{1}^{\mathrm{ri}}(T)$ be the class of objects:

$$
\mathfrak{m}(T)=\mathfrak{m}=\left(X, X_{n}^{T}, \bar{f}^{T}: n<\omega\right)=\left(X, X_{n}, \bar{f}: n<\omega\right)
$$

satisfying the following requirements:
(a) $X_{0} \neq \emptyset$ and, for $n<\omega, X_{n}$ is finite and $X_{n} \subsetneq X_{n+1}$, and $X_{<n}=\bigcup_{\ell<n} X_{\ell}$;
(b) $\bar{f}=\left(f_{t}: t \in T\right)$;
(c) if $n>0$ and $t \in T_{n} \backslash T_{<n}$, then $f_{t}$ is a one-to-one function from $X_{n-1}$ into $X_{n}$;
(d) for every $t \in T, X_{0} \cap \operatorname{ran}\left(f_{t}\right)=\emptyset$;
(e) if $s \leqslant_{T} t \in T_{n}$, then $f_{s} \subseteq f_{t}$;
(f) if $t \in T_{n+1} \backslash T_{n}, f_{t}(x)=y$ and $y \in X_{n}$, then for some $s<_{T} t, x \in \operatorname{dom}\left(f_{s}\right)$;
(g) if $s, t \in T_{n}$ and $y \in \operatorname{ran}\left(f_{s}\right) \cap \operatorname{ran}\left(f_{t}\right)$, then for some $r \in T_{n}$ such that $r \leqslant_{T} s, t$ we have that $y \in \operatorname{ran}\left(f_{r}\right)$, equivalently, $\operatorname{ran}\left(f_{s}\right) \cap \operatorname{ran}\left(f_{t}\right)=\operatorname{ran}\left(f_{r}\right)$, for $r=s \wedge t$, where $\wedge$ is the natural semi-lattice operation taken in the tree $\left(T,<_{T}\right)$;
(h) $X_{n+1} \supsetneq \bigcup\left\{\operatorname{ran}\left(f_{t}\right): t \in T_{n+1} \backslash T_{n}\right\} \cup X_{n}$;
(i) we let $X=X^{\mathfrak{m}}=\bigcup_{n<\omega} X_{n}$;
(j) if $f_{s}(x)=f_{t}(x)$ and $x \in X_{n} \backslash X_{<n}$, then we have the following:

$$
f_{s} \upharpoonright X_{n}=f_{t} \upharpoonright X_{n} \text { and } X_{n} \subseteq \operatorname{dom}\left(f_{s}\right) \cap \operatorname{dom}\left(f_{t}\right)
$$

Notation 5.3. For $x \in X$, we let $\mathbf{n}(x)$ be the unique $n<\omega$ such that $x \in X_{n} \backslash X_{<n}$ (so e.g. $x \in X_{0}$ implies $\mathbf{n}(x)=0$ ).
Convention 5.4. $\mathfrak{m}=\left(X, X_{n}, \bar{f}: n<\omega\right) \in \mathrm{K}_{1}^{\text {ri }}(T)$ (cf. 5.2 and 5.6 below).
Observation 5.5. In the context of Definition 5.2, we have:
(1) If $m<n<\omega, t \in T_{n} \backslash T_{<n}$ and for every $s<_{T} t$ we have $s \in T_{m}$, then:

$$
\left(X_{n-1} \backslash X_{m}\right) \cap \operatorname{ran}\left(f_{t}\right)=\emptyset
$$

(2) If $t \in T$, then for every $x \in \operatorname{dom}\left(f_{t}\right)$ we have that $x \neq f_{t}(x)$, moreover there is a unique $0<n<\omega$ such that $x \in X_{n-1}$ and $f_{t}(x) \in X_{n} \backslash X_{n-1}$, and for some $s \in T_{n} \backslash T_{<n}$ we have $s \leqslant_{T} t$ and $f_{s}(x)=f_{t}(x)$.

Proof. We prove (1), by Definition 5.2 (c) we know that $f_{t}$ is one-to-one from $X_{n-1}$ into $X_{n}$. If $n=1$, then $m=0$ and so $X_{n-1}=X_{0}=X_{m}$, thus the conclusion is trivial. Suppose then that $n>1$ and let $y \in\left(X_{n-1} \backslash X_{m}\right) \cap \operatorname{ran}\left(f_{t}\right)$, and let $x \in \operatorname{dom}\left(f_{t}\right)$ be such that $f_{t}(x)=y$. Then, by Definition 5.2 f$)$ there exists $s<_{T} t$ such that $x \in \operatorname{dom}\left(f_{s}\right)$. But then, using the assumption in (1), we have that $s \in T_{m}$ (so $m=0$ is impossible by Definition 5.1(3)). Hence, by Definition 5.2 (c), $\operatorname{ran}\left(f_{s}\right) \subseteq X_{m}$, so $y=f(x) \in X_{m}$, contradicting the fact that $y \in\left(X_{n-1} \backslash X_{m}\right)$.
We prove (2). Assume that $x, t$, and thus also $f_{t}$, are fixed and $x \in \operatorname{dom}\left(f_{t}\right)$. Let $s \leqslant_{T} t$ be $\leqslant_{T}$-minimal such that $f_{s}(x)$ is well-defined, and let $n<\omega$ be such that $s \in T_{n} \backslash T_{<n}$ (notice that $n \geqslant 1$ since $T_{0}=\emptyset$ ). Clearly, there is unique $m<\omega$ such that $x \in X_{m} \backslash X_{<m}$. As $x \in \operatorname{dom}\left(f_{s}\right)$ and $s \in T_{n} \backslash T_{<n}$ necessarily $m<n$, so $x \in X_{<n}$. But by the choice of $s$ we have that $r<_{T} s$ implies $x \notin \operatorname{dom}\left(f_{r}\right)$. By the last two sentences and Def. 5.2 f ) we have $f_{s}(x) \in X_{n} \backslash X_{<n}$, but $f_{t}(x)=f_{s}(x)$.

Claim 5.6. For $T$ as in Hypothesis 5.1, $\mathrm{K}_{1}^{\mathrm{ri}}(T) \neq \emptyset$ (cf. Definition 5.2).
Proof. Straightforward.
Definition 5.7. On $X$ (cf. Convention 5.4) we define:
(1) for $x \in X, \operatorname{suc}(x)=\left\{f_{t}(x): t \in T, x \in \operatorname{dom}\left(f_{t}\right)\right\}$;
(2) for $x, y \in X$, we let $x<_{X} y$ if and only if for some $0<n<\omega$ and $x_{0}, \ldots, x_{n} \in X$ we have that $\bigwedge_{\ell<n} x_{\ell+1} \in \operatorname{suc}\left(x_{\ell}\right), x=x_{0}$ and $y=x_{n}$;
(3) $\operatorname{seq}_{k}(X)=\left\{\bar{x} \in \operatorname{seq}_{k}(X): \bar{x}\right.$ is injective $\}$;
(4) we say that $\bar{x} \in \operatorname{seq}_{k}(X)$ is reasonable when the following happens:
$n(1)<n(2), x_{i(1)} \in X_{n(1)} \backslash X_{<n(1)}, x_{i(2)} \in X_{n(2)} \backslash X_{<n(2)} \Rightarrow i(1)<i(2) ;$
(5) $<_{X}^{k}$ is the partial order on $\operatorname{seq}_{k}(X)$ defined as $\bar{x}^{1}<_{X}^{k} \bar{x}^{2}$ if and only if $\bar{x}^{1}, \bar{x}^{2} \in$ $\operatorname{seq}_{k}(X)$ and there are $0<n<\omega, \bar{y}^{0}, \ldots, \bar{y}^{n} \in \operatorname{seq}_{k}(X)$ and $t_{0}, \ldots, t_{n-1} \in T$ such that for every $\ell<n$ we have that $f_{t_{\ell}}\left(\bar{y}^{\ell}\right)=\bar{y}^{\ell+1}$, and $\left(\bar{x}^{1}, \bar{x}^{2}\right)=\left(\bar{y}^{0}, \bar{y}^{n}\right)$;
(6) notice that for $k=1$ we have that $<_{X}^{k}=<_{X}$, where $<_{X}$ is as in (2) (ignoring the difference between $x$ and $(x)$, for $x \in X)$;
(7) for $k \geqslant 1$, let $E_{k}$ be the closure of $\left\{(\bar{x}, \bar{y}): \bar{x}<_{X}^{k} \bar{y}\right\}$ to an equivalence relation.

Observation 5.8. If $\bar{x}^{1} \leqslant \begin{gathered}k \\ x^{2} \\ \text { (cf. 5.7(5)), then there is a unique } \bar{t} \text { such that: }\end{gathered}$
(a) $\bar{t} \in T^{n}$ for some $n<\omega$;
(b) $f_{\bar{t}}\left(\bar{x}^{1}\right)=\bar{x}^{2}$, where $f_{\bar{t}}=\left(f_{t_{n-1}} \circ \cdots \circ f_{t_{0}}\right)$ and $t_{0}, \ldots, t_{n-1}$ are as as in 5.7 (5);
(c) for every $\ell<n$, there is no $s<_{T} t_{\ell}$ such that $f_{s}\left(\bar{y}_{\ell}\right)$ is well-defined, where $\left(\bar{y}_{0}, \ldots, \bar{y}_{n-1}\right)$ are as in 5.7(5);
(d) if $\bar{t}^{\prime} \in T^{n}$ is as in clauses (a)-(b) above and $\ell<n$, then $t_{\ell} \leqslant_{T} t_{\ell}^{\prime}$.

Observation 5.9. (1) $\left(X,<_{X}\right)$ is a tree with $\omega$ levels;
(2) every $z \in X_{0}$ is a root of the tree $\left(X,<_{X}\right)$, further, for every $n<\omega$, some $z \in X_{n+1} \backslash X_{n}$ is a root of the tree $\left(X,<_{X}\right)$, and so $z / E_{1} \cap X_{n}=\emptyset$;
(3) if $y \in X_{n+1} \backslash X_{n}$, then for at most one $x \in X_{n}$ we have $y \in \operatorname{suc}(x)$;
(4) if $y \in \operatorname{suc}(x)$, then $\left\{t \in T: f_{t}(x)=y\right\}$ is a cone of $T$;
(5) if $\bar{x} \in \operatorname{seq}_{k}(X)$, then some permutation of $\bar{x}$ is reasonable (cf. Definition5.7(4));
(6) if $f_{t}(\bar{x})=\bar{y}$ and $\bar{x}$ is reasonable, then so is $\bar{y}$;
(7) for every $1 \leqslant k<\omega,\left(\operatorname{seq}_{k}(X),<_{X}^{k}\right)$ is a tree with $\omega$ levels;
(8) if $\bar{x}<_{X}^{k} \bar{y}$ and $\bar{x}$ is reasonable, then $\bar{y}$ is also reasonable;
(9) if $\bar{x} \in \operatorname{seq}_{k}(X)$ is reasonable, $\bar{x} \leqslant{ }_{X}^{k} \bar{y}^{1}=\left(y_{0}^{1}, \ldots, y_{k-1}^{1}\right), \bar{x} \leqslant{ }_{X}^{k} \bar{y}^{2}=\left(y_{0}^{2}, \ldots, y_{k-1}^{2}\right)$ and $y_{k-1}^{1}=y_{k-1}^{2}$, then $\bar{y}^{1}=\bar{y}^{2}$;
(10) for every $t \in T$, $\operatorname{dom}\left(f_{t}\right)$ is $X_{n}$, for some $n<\omega$, and we have:

$$
x, y \in \operatorname{dom}\left(f_{t}\right) \wedge \mathbf{n}(x)=\mathbf{n}(y) \Rightarrow \mathbf{n}\left(f_{t}(x)\right)=\mathbf{n}\left(f_{t}(y)\right) ;
$$

(11) like (10) with $\bar{t} \in T^{n}$, $n \geqslant 1$, where we let:

$$
f_{\bar{t}}=\left(f_{t_{n-1}} \circ \cdots \circ f_{t_{0}}\right) ;
$$

(12) recalling the notation from (11), if $f_{\bar{t}_{1}}(x)=f_{\bar{t}_{2}}(x)$, then $\lg \left(\bar{t}_{1}\right)=\lg \left(\bar{t}_{2}\right)=k$; moreover, letting $\bar{t}_{1}=\left(t_{(1, \ell)}: \ell<k\right)$ and $\bar{t}_{2}=\left(t_{(2, \ell)}: \ell<k\right)$, if $\bar{t}_{1}$ is as in 5.8 , then we have that $\ell<\lg \left(\bar{t}_{1}\right)$ implies that $t_{(1, \ell)} \leqslant_{T} t_{(2, \ell)}$.
Proof. Items (1)-(2) are clear, where (2) is by 5.2 h). Item (3) is by Definition $5.2(\mathrm{f})$ (g). Items (4) and (5) are also easy (and (4) is not used (except in 5.11, 1p) but we retain it to give the picture). Item (6) can be proved for $t \in T_{n} \backslash T_{<n}$ by induction on $n<\omega$. Finally, (7) and (8) are easy, and (9) is easy to see using 5.8 and $5.2(\mathrm{j})$. Also clauses (10), (11) are easy, and clause (12) holds by 5.8 .

Definition 5.10. Let $\mathfrak{m} \in \mathrm{K}_{1}^{\mathrm{ri}}(T)$ (i.e. as in Convention 5.4).
(1) Let $G_{2}=G_{2}[\mathfrak{m}]$ be $\bigoplus\{\mathbb{Q} x: x \in X\}$.
(2) Let $G_{0}=G_{0}[\mathfrak{m}]$ be the subgroup of $G_{2}$ generated by $X$, i.e., $\bigoplus\{\mathbb{Z} x: x \in X\}$.
(3) For $t \in T$, let:
(a) $H_{(2, t)}=\bigoplus\left\{\mathbb{Q} x: x \in \operatorname{dom}\left(f_{t}\right)\right\}$;
(b) $I_{(2, t)}=\bigoplus\left\{\mathbb{Q} x: x \in \operatorname{ran}\left(f_{t}\right)\right\}$;
(c) $\hat{f}_{t}^{2}$ is the (unique) isomorphism from $H_{(2, t)}$ onto $I_{(2, t)}$ such that $x \in \operatorname{dom}\left(f_{t}\right)$ implies that $\hat{f}_{t}^{2}(x)=f_{t}(x)(c f$. Definition 5.2 (c)).
(4) For $t \in T$, we define $H_{(0, t)}:=H_{(2, t)} \cap G_{0}$ and $I_{(0, t)}:=I_{(2, t)} \cap G_{0}$;
(5) For $\hat{f}_{t}^{2}$ as above, we have that $\hat{f}_{t}^{2}\left[H_{(0, t)}\right]=I_{(0, t)}$. We define $\hat{f}_{t}^{0}$ as $\hat{f}_{t}^{2} \upharpoonright H_{(0, t)}$.
(6) We define the partial order $<_{*}$ on $G_{0}^{+}$by letting $a<_{*} b$ if and only if $a \neq b \in G_{0}^{+}$ and, for some $0<n<\omega, a_{0}, \ldots, a_{n} \in G_{0}, a_{0}=a, a_{n}=b$ and:

$$
\ell<n \Rightarrow \exists t \in T\left(\hat{f}_{t}^{0}\left(a_{\ell}\right)=a_{\ell+1}\right)
$$

(7) For $a=\sum_{\ell<m} q_{\ell} x_{\ell}$, with $x_{\ell} \in X$ and $q_{\ell} \in \mathbb{Q}^{+}$, let $\operatorname{supp}(a)=\left\{x_{\ell}: \ell<m\right\}$.
(8) For $a \in G_{2}^{+}$, let $\mathbf{n}(a)$ be the minimal $n<\omega$ such that $a \in\left\langle X_{n}\right\rangle_{G_{2}}^{*}$.

While the aim of Definition 5.10 should be clear from the explanations given at the beginning of this section, the reader may wonder what is the aim of Lemma 5.11 and Claim 5.12 In the crucial proof of this section we will show that given an endomorphism $\pi$ of $G_{1}$ and $x \in X$ we have that $\pi(x)$ has the form $q y$ for some $y \in Y$ and $q \in \mathbb{Q}$, this requires a detailed analysis of supports, hence 5.11 and 5.12 .

Lemma 5.11. (1) If $\left\{t \in T: \hat{f}_{t}^{2}(a)=b\right\} \neq \emptyset$, then it is a cone of $T$.
(2) $<_{*} \upharpoonright X=<_{X}$ (where $<_{X}$ is as in Definition 5.7(2)).
(3) $\left(G_{0}^{+},<_{*}\right)$ is a countable tree with $\omega$ levels (recall Hypothesis 5.1 1)).
(4) If $s \leqslant_{T} t$, then $\hat{f}_{s}^{\ell} \subseteq \hat{f}_{t}^{\ell}$, for $\ell \in\{0,2\}$.
(5) If $t \in T, \hat{f}_{t}^{2}(a)=b$ and $a \in G_{0}^{+}$, then $\mathbf{n}(a)<\mathbf{n}(b)$ (cf. Definition 5.10.8)).
(6) If $a<_{*} b$ (so $a, b \in G_{0}^{+}$), then the sequence $\left(a_{\ell}: \ell \leqslant n\right)$ from 5.10 6) is unique.
(7) If $a_{1}<_{*} a_{2}$, and, for $\ell \in\{1,2\}$, $a_{\ell}=\sum_{i<k} q_{i}^{\ell} x_{i}^{\ell}, q_{i}^{\ell} \in \mathbb{Q}^{+}$, $\bar{x}^{\ell}=\left(x_{i}^{\ell}: i<k\right) \in$ $\operatorname{seq}_{k}(X)$, then maybe after replacing $\bar{x}^{1}$ with a permutation of it we have:

$$
\bar{x}^{0} \leqslant_{X}^{k} \bar{x}^{1} \text { and } q_{i}^{1}=q_{i}^{2}(\text { for } i<k) .
$$

Proof. Unraveling definitions, we elaborate only on item (5). As $a \neq 0$, let $a=$ $\sum_{i \leqslant n} q_{i} x_{i}, x_{i} \in X$ with no repetitions, $q_{i} \in \mathbb{Q}^{+}$. Let $x_{i} \in X_{k(i)} \backslash X_{<k(i)}$ and w.l.o.g. $k(i) \leqslant k(i+1)$, for $i<n$ (cf. Observation 5.9 5p). Clearly $a \in\left\langle X_{k(n)}\right\rangle_{G_{2}}^{*}$ but $a \notin\left\langle X_{<k(n)}\right\rangle_{G_{2}}^{*}$. As $\hat{f}_{t}^{2}(a)$ is well-defined, clearly $\left\{x_{i}: i \leqslant n\right\} \subseteq \operatorname{dom}\left(f_{t}\right)$ and $b=\hat{f}_{t}^{2}(a)=\sum_{i \leqslant n} q_{i} f_{t}\left(x_{i}\right)$ and, as $f_{t}$ is 1-to-1, the sequence $\left(f_{t}\left(x_{i}\right): i \leqslant n\right)$ is with no repetitions. By Observation 5.5 (2) applied with $n$ there as $k(n)$ here, $f_{t}\left(x_{n}\right) \notin\left\langle X_{k(n)}\right\rangle_{G_{2}}^{*}$, hence we have that $\mathbf{n}(b) \geqslant n\left(f_{t}\left(x_{n}\right)\right)>k(n)=\mathbf{n}(a)$.
Claim 5.12. If $(A)$, then $(B)$, where:
(A) (a) $a, b_{\ell} \in G_{2}^{+}$, for $\ell<\ell_{*}$;
(b) $a \leqslant_{*} b_{\ell}$ and the $b_{\ell}$ 's are with no repetitions;
(c) $a=\sum\left\{q_{i} x_{i}: i<j\right\}, q_{i} \in \mathbb{Q}^{+}$;
(d) $\bar{x}=\left(x_{i}: i<j\right) \in \operatorname{seq}_{j}(X)$ and it is reasonable;
(B) there are, for $\ell<\ell_{*}, \bar{y}^{\ell}=\left(y_{(\ell, i)}: i<j\right)$ such that:
(a) $y_{(\ell, i)}=: y_{i}^{\ell} \in X$ and $\bar{x} \leqslant_{X}^{j} \bar{y}^{\ell}$ (cf. Definition 5.7(5));
(b) $b_{\ell}=\sum\left\{q_{i} y_{(\ell, i)}: i<j\right\}$, (so the $\bar{y}^{\ell}$ are pairwise distinct, as the $b_{\ell}$ 's are);
(c) $\left(y_{(\ell, i)}: i<j\right) \in \operatorname{seq}_{j}(X)$ and it is reasonable;
(d) if $j>1$ and $\ell_{*}>1$, then there are $\ell_{1} \neq \ell_{2}<\ell_{*}$ and $i_{1}, i_{2}<j$ such that:
(i) if $\ell<\ell_{*}, i<j$ and $y_{(\ell, i)}=y_{\left(\ell_{1}, i_{1}\right)}$, then $(\ell, i)=\left(\ell_{1}, i_{1}\right)$;
(ii) if $\ell<\ell_{*}, i<j$ and $y_{(\ell, i)}=y_{\left(\ell_{2}, i_{2}\right)}$, then $(\ell, i)=\left(\ell_{2}, i_{2}\right)$.

Proof. By the definition of $\leqslant_{*}$ there are $\left(y_{(\ell, i)}: i<j, \ell<\ell_{*}\right)$ and by by 5.9 6 ) and 5.117 they satisfying clauses $(a)-(c)$ of $(B)$. Recall that $\left(\left\{\bar{y}: \bar{x} \leqslant_{X}^{j} \bar{y}\right\}, \leqslant_{X}^{j}\right)$ is a tree $\left(\operatorname{as}\left(\operatorname{seq}_{j}(X), \leqslant_{X}^{j}\right)\right.$ is a tree $)$. We now show $(B)(\mathrm{d})$. There are two cases.
Case 1. $\left\{\bar{y}^{\ell}: \ell<\ell_{*}\right\}$ is not linearly ordered by $\leqslant_{X}^{j}$.
Then there are $\ell(1) \neq \ell(2)<\ell_{*}$ such that $\bar{y}^{\ell(1)}, \bar{y}^{\ell(2)}$ are locally $\leqslant_{X}^{j}$-maximal. So we can choose $i_{1}, i_{2}<j$ such that we have the following:

$$
x_{i_{1}}^{\ell_{1}} \in X_{\mathbf{n}\left(b_{\ell_{1}}\right)} \backslash X_{<\mathbf{n}\left(b_{\ell_{1}}\right)} \text { and } x_{i_{2}}^{\ell_{2}} \in X_{\mathbf{n}\left(b_{\ell_{2}}\right)} \backslash X_{<\mathbf{n}\left(b_{\ell_{2}}\right)}
$$

notice that using the assumption that the sequences are reasonable we can choose $i_{1}=j-1=i_{2}$, see 5.11 5. and 5.9. 9 . Hence, $\ell_{1}, \ell_{2}, i_{1}, i_{2}$ are as required for (d). Case 2. Not Case 1.
So w.l.o.g. we have that, for every $\ell<\ell_{*}-1, \bar{y}^{\ell}<_{X}^{j} \bar{y}^{\ell+1}$. Now, for $\ell<\ell_{*}$ and $i<j$, let $n(\ell, i)=\mathbf{n}\left(y_{i}^{\ell}\right)$. Let then:
$\left(\cdot{ }_{1}\right) i(1)<j$ be such that $i<j$ implies $n(0, i) \geqslant n(0, i(1))$;
$\left(\cdot{ }_{2}\right) \quad i(2)<j$ be such that $i<j$ implies $n\left(\ell_{*}-1, i\right) \leqslant n\left(\ell_{*}-1, i(2)\right)$.
Then $(0, i(1)),\left(\ell_{*}-1, i(2)\right)$ are as required. As, for $\ell<\ell_{*}, \bar{y}^{\ell}$ is reasonable we can actually choose $i(1), i(2)$ such that $i(1)=0$ and $i(2)=j_{*}-1$.

Now we turn to the groups which we shall actually use, i.e., the groups $G_{1}=$ $G_{1}[T]$ defined in 5.132 below. Our aim is to include among the partial automorphisms of $G_{1}$ all the maps of the form $\hat{f}_{t}$, i.e., the maps induced by the $f_{t}$ 's, but we want in addition that $G_{1}$ is minimal modulo this. So to each $a \in G_{0}^{+}$we assign a prime number $p_{a}$ and add $p^{-m} a$ to $G_{1}$, for all $m<\omega$. But in order to respect the $\hat{f_{t}}$ 's, when $a \in \operatorname{dom}\left(\hat{f}_{t}\right)$ we have to add also $p^{-m} \hat{f}_{t}(a)$ to $G_{1}$, for all $m<\omega$. Of course all the $\hat{f}_{s}^{\prime}$ 's have to respect this, so we add also $p^{-m} \hat{f}_{\bar{t}}(a)$ to $G_{1}$, for all $m<\omega$, where $\bar{t}=\left(t_{0}, \ldots, t_{n}\right)$ and $\hat{f}_{\bar{t}}=\hat{f}_{t_{n}} \circ \cdots \circ \hat{f}_{t_{0}}$ (and $\hat{f}_{\bar{t}}(a)$ is well-defined). This is done in 5.13. In 5.14 5.15 we analyze the groups $G_{(1, p)}=\left\{a \in G_{1}: G_{1}=p^{\infty} \mid a\right\}$.

Definition 5.13. Let $\left(p_{a}: a \in G_{0}^{+}\right)$be a sequence of pairwise distinct primes s.t.:

$$
a=\sum_{\ell<k} q_{\ell} x_{\ell}, q_{\ell} \in \mathbb{Z}^{+},\left(x_{\ell}: \ell<k\right) \in \operatorname{seq}_{k}(X) \Rightarrow p_{a} \not \backslash q_{\ell}
$$

(1) For $a \in G_{0}^{+}$, let:

$$
\mathbb{P}_{a}^{\leqslant_{*}}=\left\{p_{b}: b \in G_{0}^{+}, b \leqslant_{*} a\right\} .
$$

(2) Let $G_{1}=G_{1}[\mathfrak{m}]=G_{1}[\mathfrak{m}(T)]=G_{1}[T]$ be the subgroup of $G_{2}$ generated by:

$$
\left\{m^{-1} a: a \in G_{0}^{+}, m \in \omega \backslash\{0\} \text { a power of a prime from } \mathbb{P}_{a}^{\leqslant_{*}}\right\}
$$

(3) For a prime $p$, let $G_{(1, p)}=\left\{a \in G_{1}: a\right.$ is divisible by $p^{m}$, for every $\left.0<m<\omega\right\}$ (notice that, by Observation 2.5. $G_{(1, p)}$ is always a pure subgroup of $G_{1}$ ).
(4) For $b \in G_{1}^{+}$, let $\mathbb{P}_{b}=\left\{p_{a}: a \in G_{0}^{+}, G_{1} \models \bigwedge_{m<\omega} p_{a}^{m} \mid b\right\}$.
(5) For $t \in T$ and $\ell \in\{0,1,2\}$, let:

$$
H_{(\ell, t)}=\left\langle x: x \in \operatorname{dom}\left(f_{t}\right)\right\rangle_{G_{\ell}}^{*} \quad \text { and } \quad I_{(\ell, t)}=\left\langle x: x \in \operatorname{ran}\left(f_{t}\right)\right\rangle_{G_{\ell}}^{*}
$$

Remark 5.14. (1) If $a, b \in G_{1}^{+}$and $\mathbb{Q} a=\mathbb{Q} b \subseteq G_{2}$, then $\mathbb{P}_{a}=\mathbb{P}_{b}$.
(2) If $a \leqslant_{*} b$, then $\mathbb{P}_{a} \subseteq \mathbb{P}_{b}$.

Proof. Essentially as in Observation 2.5 .
Here we look more deeply at $G_{1}$. The crucial point is that any endomorphism of $G_{1}$ maps $G_{(1, p)}=\left\{a \in G_{1}\right.$ : for all $\left.m<\omega, p^{m} \mid a\right\}$ into itself, and so the following characterization of $G_{(1, p)}$ will allow us to reconstruct information on the action of the $f_{t}$ 's on $X$, and thus eventually to reconstruct the tree $T$, to some extent.

Lemma 5.15. (1) For $b \in G_{0}^{+}$we have that $\mathbb{P}_{b}^{\leqslant *}=\mathbb{P}_{b}$.
(2) If $p=p_{a}, a \in G_{0}^{+}$, then:

$$
G_{(1, p)}=\left\langle b \in G_{0}^{+}: a \leqslant_{*} b\right\rangle_{G_{1}}^{*} .
$$

(3) For $t \in T, H_{(1, t)}:=H_{(2, t)} \cap G_{1}$ and $I_{(1, t)}:=I_{(2, t)} \cap G_{1}$ are pure in $G_{1}$.
(4) For $\hat{f}_{t}^{2}$ as in Definition 5.10 3c), $\hat{f}_{t}^{2}\left[H_{(1, t)}\right] \subseteq I_{(1, t)}$. We define:

$$
\hat{f}_{t}^{1}=\hat{f}_{t}^{2} \upharpoonright H_{(1, t)}
$$

and for $\bar{t}$ a finite sequence of members of $T$ we let:

$$
\hat{f}_{\bar{t}}^{1}=\left(\cdots \circ \hat{f}_{t_{\ell}}^{1} \circ \cdots\right)
$$

(5) $\hat{f}_{t}^{1} \upharpoonright H_{(1, t)}=\hat{f}_{t}^{2} \upharpoonright H_{(1, t)}$ is into $I_{(1, t)} \leqslant G_{1}$ but it is not onto $I_{(1, t)}$.
(6) Assume $a=\sum_{\ell<k} q_{\ell} x_{\ell} \in G_{0}, k>0, x_{\ell} \in X, q_{\ell} \in \mathbb{Q}^{+}, \bar{x}=\left(x_{\ell}: \ell<k\right) \in$ $\operatorname{seq}_{k}(X)$ and $p=p_{a}$. If $b \in G_{(1, p)}$, then there are $j>0, m>0$, and, for $i<j$, $\bar{y}^{i}, b_{i}$ and $q_{i}^{\prime} \in \mathbb{Q}^{+}$such that the following conditions are verified:
(a) for $i<j, \bar{x} \leqslant{ }_{X}^{k} \bar{y}^{i}$;
(b) $\left(b_{i}=\sum_{\ell<k} q_{\ell} y_{\ell}^{i}: i<j\right)$ is linearly independent;
(c) $b=\sum\left\{q_{i}^{\prime} b_{i}: i<j\right\}$;
(d) for $i<j, m a \leqslant * m b_{i}$.

Proof. Item (1) is easy. We prove item (2). The RTL inclusion is clear by 5.13(2). We prove the other implication. To this extent:
$\left(*_{1}\right) a \in G_{0}^{+}, p=p_{a}$ and we let $W_{p}:=\left\{b \in G_{0}^{+}: a \leqslant_{*} b\right\}$.
We claim:
$\left(*_{2}\right) W_{p}$ is a linearly independent subset of $G_{2}$, as a $\mathbb{Q}$-vector space.
[Why $\left(*_{2}\right)$ ? Let $k \geqslant 1, \bar{x} \in \operatorname{seq}_{k}(X), \bar{q} \in\left(\mathbb{Z}^{+}\right)^{k}$ and $a=\sum\left\{q_{\ell} x_{\ell}: \ell<k\right\}$ (recall that $\left.a \in G_{0}^{+}\right)$. W.l.o.g. $\bar{x}$ is reasonable. Now, toward contradiction, assume that $n \geqslant 1, b_{i} \in W_{p}$, for $i<n,\left(b_{i}: i<n\right)$ is without repetitions and there are $q^{i} \in \mathbb{Q}^{+}$, for $i<n$, such that:
$\left(*_{2.1}\right) \sum\left\{q^{i} b_{i}: i<n\right\}=0$.
For each $i<n$, let $b_{i}=\sum\left\{q_{\ell} x_{(i, \ell)}: \ell<k\right\}$, where $\bar{x} \leqslant_{X}^{k} \bar{x}_{i}=\left(x_{(i, \ell)}: \ell<k\right)$. As $a \in G_{1}^{+}$, clearly $n>1$, and by 5.9 7 there is $i_{*}<n$ such that $\bar{x}_{i_{*}}$ is $<_{X}^{k}$-maximal in $\left\{\bar{x}_{i}: i<n\right\}$. As $\bar{x}$ is reasonable, so is $\bar{x}_{i_{*}}$ and so $x_{\left(i_{*}, n-1\right)}$ appears exactly once in $\left(*_{2.1}\right)$, so recalling $q^{n-1} \in \mathbb{Q}^{+}$we get a contradiction, and so $\left(*_{2}\right)$ holds indeed.]
$\left(*_{3}\right)$ Let $\mathcal{U} \subseteq X$ be such that:
(a) if $y \in \mathcal{U}$, then $y \notin\left\langle W_{p}\right\rangle_{G_{2}}^{*}$;
(b) $\mathcal{U} \cup W_{p}$ is linearly independent;
(c) under conditions (a), (b), $\mathcal{U}$ is maximal.

Clearly $\mathcal{U}$ is well-defined, and we have:
$\left(*_{4}\right)$ (a) the disjoint union $\mathcal{U} \cup W_{p}$ is a basis of $G_{2}$, as a $\mathbb{Q}$-vector space;
(b) let $h \in \operatorname{End}\left(G_{2}\right)$ be s.t. $h \upharpoonright \mathcal{U}$ is the identity and $h(a)=0$, for all $a \in W_{p}$.

Now we define:
(*5)
(a) $G_{1}^{\prime}:=\left(\sum\{\mathbb{Q} y: y \in \mathcal{U}\}\right)+G_{1}$;
(b) $G_{1}^{\prime \prime}=\sum\left\{\mathbb{Q}_{p} y: y \in \mathcal{U}\right\}+G_{1}$.

Also, we have:
$\left(*_{6}\right)$ (a) $h \upharpoonright G_{1}^{\prime \prime} \in \operatorname{End}\left(G_{1}^{\prime \prime}\right)$;
(b) if $d \in G_{1}^{\prime \prime}$ and $G_{1}^{\prime \prime}=p^{\infty} \mid d$, then $d=0$;
(c) $G_{1}^{\prime}=G_{2}^{\prime \prime}$.
[Why $\left.\left(*_{6}\right)\right)$ ? Concerning clause (a), we just have to prove that if $b \in G_{0}^{+}, p^{\prime} \in \mathbb{P}_{b}$, so $p^{\prime}=p_{d}$, for some $d \leqslant_{*} b$, then, for every $m<\omega, h\left(p_{d}^{-m} b\right)=p_{d}^{-m} h(b) \in G_{1}^{\prime \prime}$. Now, if $d=a$, then $p_{d}=p$ and $a \in W_{p}$, hence $h(b)=0$, so fine. If on the other hand $d \neq a$, then $p_{d} \neq p$. Notice that the support of $h(b)$ is a subset of $\mathcal{U}$. Now, $\left\{b^{\prime} \in G_{1}^{\prime \prime}: \operatorname{supp}\left(b^{\prime}\right) \subseteq \mathcal{U}\right\}=\bigoplus\left\{\mathbb{Q}_{p} x: x \in \mathcal{U}\right\}$, which is $p_{d}$-divisible, so clause (a) holds indeed. Finally clauses (b) and (c) hold by the definitions of $\mathbb{Q}_{p}$ and $G_{1}^{\prime}$.] Now, let $c$ be any member of $G_{(1, p)}$. As $h \upharpoonright G_{1}^{\prime \prime} \in \operatorname{End}\left(G_{1}^{\prime \prime}\right)$ clearly $h(c) \in G_{1}^{\prime \prime}$ and as $m<\omega$ implies $p^{-m} c \in G_{(1, p)}$ clearly $G_{1}^{\prime \prime} \models p^{\infty} \mid h(c)$. By $\left(*_{6}\right)(\mathrm{b})$, it follows that $h(c)=0$, but this implies that $c$ belongs to the kernel of $h \upharpoonright G_{1}$, which is $\left\langle W_{p}\right\rangle_{G_{1}}^{*}$. As $c$ was any member of $G_{(1, p)}$ we are done. This concludes the proof of item (2).
Concerning item (3), notice:

$$
\begin{aligned}
H_{(1, t)} & =\left\langle\mathbb{Z} x: x \in \operatorname{dom}\left(f_{t}\right)\right\rangle_{G_{1}}^{*} \\
I_{(1, t)} & =\left\langle\mathbb{Z} x: x \in \operatorname{ran}\left(f_{t}\right)\right\rangle_{G_{1}}^{*}
\end{aligned}
$$

Item (4) is by item (2) and the following observation, if $f_{t}(x)=y$, then we have $x \leqslant_{*} y$ (recall 5.7/2p), and so $\mathbb{P}_{x} \subseteq \mathbb{P}_{y}$ (cf. 5.14/2p). Concerning item (5), assume that $0<n<\omega, t \in T_{n} \backslash T_{<n}, x \in X_{n-1} \backslash X_{<n-1}$ and let $y=f_{t}(x) \in X_{n} \backslash X_{<n}$ (cf. Observation 5.5), notice that in particular $x<_{*} y$. So $p_{y}$ is well-defined, since $y \in G_{0}^{+}$, and we have the following:
(a) $G_{1} \models p_{y} \not \backslash x$, and so $H_{(1, t)} \models p_{y} \not \backslash x$ (as $H_{(1, t)}$ is pure in $G_{1}$, cf. item (3));
(b) $G_{1} \models \bigwedge_{m<\omega} p_{y}^{m} \mid y$.
[Why (b)? By the definition of $G_{1}$. Why (b)? Recalling that $x<_{*} y$.] But then, since by item (4), $\hat{f}_{t} \upharpoonright H_{(1, t)}$ is an embedding of $H_{(1, t)}$ into $I_{(1, t)}$ we have that $\hat{f}_{t}\left[H_{(1, t)}\right] \vDash p_{y} \not \backslash f(x) \wedge f(x)=y$. On the other hand, since $I_{(1, t)}$ is pure in $G_{1}$ (cf. (3) of this lemma) we have that for every $m<\omega, p_{y}^{-m} y \in I_{(t, 1)}$ (cf. 2.4). Finally, item (6) is by clause (2) and unraveling definitions.

We now prove the main theorem of this section, namely 5.16 Notice that in 5.16 (2) below we prove more than needed in order to show that the set of endorigid groups in $\mathrm{TFAB}_{\omega}$ is complete co-analytic, as, in combination with 5.16(1) and 5.16 (3), it would suffice to show that if $T$ is well-founded then there is an endomorphism of $G_{1}$ which is not multiplication by an integer, we show that in addition such an endomorphism can be taken to be 1-to-1 and s.t. $G_{1} / f\left[G_{1}\right]$ is not torsion.
Theorem 5.16. Let $\mathfrak{m}(T) \in \mathrm{K}_{1}^{\mathrm{ri}}(T)$.
(1) We can modify the construction so that $G_{1}[\mathfrak{m}(T)]=G_{1}[T]$ has domain $\omega$ and the function $T \mapsto G_{1}[T]$ is Borel (for $T$ a tree with domain $\omega$ ).
(2) If $T$ is not well-founded, then $G_{1}[T]=G_{1}$ has a 1-to-1 $f \in \operatorname{End}\left(G_{1}\right)$ which is not multiplication by an integer and such that $G_{1} / f\left[G_{1}\right]$ is not torsion.
(3) If $T$ is well-founded, then $G_{1}[T]$ is endorigid.

Proof. Item (1) is easy. We prove item (2). Let $\left(t_{n}: n<\omega\right)$ be a strictly increasing infinite branch of $T$. By Lemma 5.114), $\left(\hat{f}_{t_{n}}^{2}: n<\omega\right)$ is increasing, by Definition $5.103 \mathrm{c}, \hat{f}_{t_{n}}^{2}$ embeds $H_{\left(2, t_{n}\right)}$ into $I_{\left(2, t_{n}\right)}$, thus $\hat{f}^{2}=\bigcup_{n<\omega} \hat{f}_{t_{n}}^{2}$ is an embedding of $G_{2}$ into $\bigcup_{n<\omega} H_{\left(2, t_{n}\right)}$. Now, $\left(H_{\left(2, t_{n}\right)}: n<\omega\right)$ is a chain of pure subgroups of $G_{2}$ with limit $G_{2}$, because, recalling 5.2 e), we have that:

$$
H_{\left(2, t_{n}\right)}=\operatorname{dom}\left(f_{t_{n}}\right) \subseteq \operatorname{dom}\left(f_{t_{n+1}}\right) \subseteq H_{\left(2, t_{n+1}\right)}
$$

and by 5.2 (c) we have that $\bigcup_{n<\omega} H_{\left(2, t_{n}\right)}=G_{2}$. Thus $\hat{f}^{1}:=\hat{f} \upharpoonright G_{1}=\bigcup_{n<\omega} \hat{f}_{t_{n}}^{1}=$ $\bigcup_{n<\omega} f_{t_{n}}^{2} \upharpoonright H_{\left(1, t_{n}\right)}$ is an embedding of $G_{1}$ into $G_{1}$ (cf. Lemma 5.15(3), (5)), in fact we have that $\operatorname{dom}\left(\hat{f}_{t_{n}}^{1}\right)=H_{\left(1, t_{n}\right)}\left(\right.$ cf. Lemma 5.15 (3), (5)) and $G_{1}=\bigcup_{n<\omega} H_{\left(1, t_{n}\right)}$, where $\left(H_{\left(1, t_{n}\right)}: n<\omega\right)$ is chain of pure subgroups of $G_{1}$ with limit $G_{1}$. Clearly $\hat{f}^{1}$ is not of the form $g \mapsto m g$ for some $m \in \mathbb{Z} \backslash\{0\}$, since for every $x \in \operatorname{dom}\left(f_{t}\right)$ we have $x \neq f_{t}(x)$ (cf. Obs. 5.5(2)). We claim that $G_{1} / \hat{f}^{1}\left[G_{1}\right]$ is not torsion. To this extent, first of all notice that $X_{0} \neq \emptyset$ (by Definition 5.2, a) and $X_{0} \cap \operatorname{ran}\left(f_{t_{n}}\right)=\emptyset$ (by Definition 5.2 d ). Thus, we have the following:

$$
\operatorname{ran}\left(\hat{f}^{1}\right) \subseteq G_{X \backslash X_{0}}^{2}:=\sum\left\{\mathbb{Q} x: x \in X \backslash X_{0}\right\}=\left\langle X \backslash X_{0}\right\rangle_{G_{2}}^{*}
$$

Now, let $x \in X_{0}$, then $x \in G_{1} \backslash \operatorname{ran}\left(\hat{f}^{1}\right)$, moreover, for $q \in \mathbb{Q} \backslash\{0\}$ :

$$
q x \notin G_{X \backslash X_{0}}^{2} \text { and so } q x \notin \operatorname{ran}\left(\hat{f}^{1}\right),
$$

and so in particular, for every $0<n<\omega$ we have that $n x \notin \operatorname{ran}\left(\hat{f}^{1}\right)$, hence $n\left(x /\left(\operatorname{ran}\left(\hat{f}^{1}\right)\right) \neq 0\right.$. This concludes the proof of item (2).
We now prove item (3). To this extent, suppose that $\left(T,<_{T}\right)$ is well-founded and, letting $G_{1}=G_{1}[T]$, suppose that $\pi \in \operatorname{End}\left(G_{1}\right)$. We shall show that there is $m \in \mathbb{Z}$ such that, for every $a \in G_{1}, \pi(a)=m a$, i.e., $G_{1}$ is endorigid. We recall that the equivalence relation $E_{1}$ (used below) was defined in 5.7,7).
Case 1. The set $Y=\left\{x / E_{1}:\right.$ for some $\left.y \in x / E_{1}, \pi(y) \notin \mathbb{Q} y\right\}$ is infinite.
$\left(*_{1}\right)$ Choose $x_{i}, n_{i}$, for $i<\omega$, such that:
(a) $n_{i}$ is increasing with $i$;
(b) $x_{i} \in X_{n_{i+1}} \backslash X_{n_{i}}$;
(c) $\pi\left(x_{i}\right) \notin \mathbb{Q} x_{i}, \operatorname{supp}\left(\pi\left(x_{i}\right)\right) \subseteq X_{n_{i+1}}$;
(d) $X_{n_{i}} \cap x_{i} / E_{1}=\emptyset$;
(e) $\left(x_{i} / E_{1}: i<\omega\right)$ are pairwise distinct (this actually follows).

Note that, for $i<\omega$, we have:
$\left(*_{2}\right) \operatorname{supp}\left(\pi\left(x_{i}\right)\right) \subseteq x_{i} / E_{1}$, hence $\operatorname{supp}\left(\pi\left(x_{i}\right)\right) \subseteq X_{n_{i+1}} \backslash X_{n_{i}}$.
[Why? We apply 5.15 6) with $\left(x_{i}, \pi\left(x_{i}\right), 1,(1)\right)$ here standing for $\left(a, b, k,\left(q_{\ell}: \ell<\right.\right.$ $k)$ ) there, so in particular $p=p_{x_{i}}$. In order to be able to apply 5.15 6) we need that $b=\pi(a) \in G_{(1, p)}$, but this is clear in our case as $\pi \in \operatorname{End}\left(G_{1}\right)$ and $p=p_{x_{i}}$. But then applying 5.15 6) and writing $b=\pi\left(x_{i}\right)$ as there we get what we need.]
For $r<\omega,\left(\operatorname{supp}\left(x_{\ell}\right): \ell \leqslant r\right)$ is a sequence of non-empty sets and $\operatorname{supp}\left(x_{\ell}\right) \subseteq X_{n_{\ell+1}} \backslash$ $X_{n_{\ell}}$, so it is a sequence of pairwise disjoint non-empty sets. Now, for $r<\omega$, let:

$$
x_{r}^{+}=\sum_{\ell \leqslant r} x_{\ell}, p_{r}=p_{x_{r}^{+}} \text {and } \bar{x}_{r}=\left(x_{\ell}: \ell \leqslant r\right)
$$

As $\pi \in \operatorname{End}\left(G_{1}\right)$, clearly $\pi\left(x_{r}^{+}\right) \in G_{\left(1, p_{r}\right)}$, hence by 5.15 6) applied to $x_{r}^{+}, \pi\left(x_{r}^{+}\right)$ here standing for $a, b$ there we can find $j_{r}, m_{r}>0$, and, for $j<j_{r}, \bar{y}^{(r, j)}, b_{j}^{r}$, $q_{j}^{r} \in \mathbb{Q}^{+}$such that the following holds:
$\left(*_{3}\right)$ (a) for $j<j_{r}, \bar{x}_{r} \leqslant_{X}^{r+1} \bar{y}^{(r, j)}$;
(b) $\left(b_{j}^{r}=\sum_{\ell \leqslant r} y_{\ell}^{(r, j)}: j<j_{r}\right)$ is linearly independent;
(c) $\pi\left(x_{r}^{+}\right)=\sum\left\{q_{j}^{r} b_{j}^{r}: j<j_{r}\right\}$;
(d) for $j<j_{r}, m_{r} x_{r}^{+} \leqslant_{*} m_{r} b_{j}^{r}$ (and $m_{r} b_{j}^{r} \in G_{0}^{+}$).
$\left(*_{3.1}\right)$ We define $f_{()}^{1}$ as the identity on $X$, hence, for $j<j_{r}$, TFAE:
$\left({ }_{1}\right) \bar{y}^{(r, j)}=\bar{x}_{r}$;
$\left(\cdot 2^{)} f_{()}^{1}\left(\bar{x}_{r}\right)=\bar{y}^{(r, j)}\right.$;
$\left(\cdot{ }_{3}\right)$ for all $0<n<\omega$ and $\bar{t} \in T^{n}, f_{\bar{t}}^{1}\left(\bar{x}_{r}\right) \neq \bar{y}^{(r, j)}$.
As $\bar{x}_{r} \leqslant_{X}^{r+1} \bar{y}^{(r, j)}$ we can apply 5.8 and find a finite sequence $\bar{t}_{j}^{r} \in T^{<\omega}$ s.t.:
$\left(*_{4}\right)$ if $\bar{x}_{r}<_{X}^{r+1} \bar{y}^{(r, j)}$, then:
(a) $\left.f_{\bar{t}_{j}^{r}}^{1} \bar{x}_{r}\right)=\bar{y}^{(r, j)}$;
(b) $\hat{f}_{t_{j}^{r}}^{1}\left(x_{r}^{+}\right)=b_{j}^{r}$;
(c) for $\ell \leqslant r$ and $j<j_{r}$ we have $f_{\bar{t}_{j}^{r}}^{1}\left(x_{\ell}\right) \neq x_{\ell}$ and $\lg \left(\bar{t}_{j}^{r}\right)>0$;
(d) $\bar{t}_{j}^{r}=\left(t_{(j, \ell)}^{r}: \ell<\lg \left(\bar{t}_{j}^{r}\right)\right)$;
(e) if $j<j_{r}$ and $\ell<\lg \left(\bar{t}_{j}^{r}\right)$, then:

$$
t<_{T} t_{(j, \ell)}^{r} \Rightarrow \bigvee_{m \leqslant r} f_{\hat{t}_{j}^{r} \upharpoonright \ell}\left(x_{m}\right) \notin \operatorname{dom}\left(f_{t}\right) ;
$$

$(f)$ in (e) this is equivalent to the following condition:

$$
t<_{T} t_{(j, \ell)}^{r} \Rightarrow f_{\bar{t}_{j}^{r} \upharpoonright \ell}\left(x_{r}\right) \notin \operatorname{dom}\left(f_{t}\right) ;
$$

(g) $\left(\bar{t}_{j}^{r}: j<j_{r}\right)$ is without repetitions;
(h) $\left(f_{\bar{t}_{j}^{r}}\left(x_{r}\right): j<j_{r}\right)$ is without repetitions.

Why $\left(*_{4}\right)$ ? Concerning (e), recall 5.8 . Concerning (f)-(h), recalling 5.9 10 , note that if $\lg \left(\bar{t}_{j}^{r}\right)>0$, then $\operatorname{dom}\left(f_{\bar{t}_{j}^{r}}\right)$ is $X_{n}$ for some $n<\omega$; so $x_{r} \in \operatorname{dom}\left(f_{f_{j}^{r}}\right)$ and:
$\left(*_{4.1}\right) \ell \leqslant r \Rightarrow x_{\ell} \in \operatorname{dom}\left(f_{\overleftarrow{t}_{j}^{r}}\right)$.
This concludes the proof of $\left(*_{4}\right)$.
$\left(*_{5}\right)$ For $r<\omega$ and $\ell \leqslant r$ we have $\pi\left(x_{\ell}\right)=\sum\left\{y_{\ell}^{(r, j)}: j<j_{r}\right\}$.
[Why? Because $\left\{y_{\ell}^{(r, j)}: j<j_{r}\right\} \subseteq x_{\ell} / E_{1}$ and $\left(x_{\ell} / E_{1}: \ell \leqslant r\right)$ is a sequence of pairwise disjoint sets.]
Now, by induction on $r<\omega$, we choose $i_{r}$ and $y_{r}$ such that:
(**) (a) $i_{r}<j_{r}, y_{r}=f_{\bar{t}_{i_{r}}}\left(x_{r}\right) \neq x_{r}$, hence $\lg \left(\bar{t}_{i_{r}}^{r}\right)>0$;
(b) if $r>0$, then $f_{\bar{t}_{i_{r}}^{r}}\left(x_{r-1}\right)=y_{r-1}$.

Why $\left(*_{6}\right)$ is possible? For $r=0$, recall that $\pi\left(x_{r}\right) \notin \mathbb{Q} x_{r}$. For $r \geqslant 1$, by $\left(*_{5}\right)$ :

$$
\sum\left\{f_{\bar{t}_{j}^{r}}\left(x_{r-1}\right): j<j_{r}\right\}=\pi\left(x_{r-1}\right)=\sum\left\{f_{\hat{t}_{j}^{r-1}}\left(x_{r-1}\right): j<j_{r-1}\right\}
$$

Now, by $\left(*_{4}\right)(\mathrm{h})$ the sum in the RHS is without repetitions and of course $f_{\bar{t}_{i_{r-1}^{r-1}}}\left(x_{r-1}\right)$ appears in it, hence it belongs to the support on the LHS, so for some $i_{r}<j_{r}$ :

$$
f_{\bar{t}_{i_{r}}^{r}}\left(x_{r-1}\right)=f_{f_{i_{i_{r-1}}^{r-1}}}\left(x_{r-1}\right)=y_{r-1} .
$$

As $f_{\bar{t}_{i_{r}}^{r}}\left(x_{r-1}\right) \neq x_{r-1}$, clearly $\lg \left(\bar{t}_{i_{r}}^{r}\right)>0$ and so $x_{r} \neq y_{r}$. This proves $\left(*_{6}\right)$.
Now, $f_{\bar{t}_{i_{r-1}}^{r-1}}\left(x_{r-1}\right)=f_{\bar{t}_{i_{r}}^{r}}\left(x_{r-1}\right)$ and $\bar{t}_{i_{r-1}}^{r-1}$ satisfies $\left(*_{4}\right)(\mathrm{e})$, hence by 5.912 we have $\lg \left(\bar{t}_{i_{r-1}}^{r-1}\right)=\lg \left(\bar{t}_{i_{r}}^{r}\right)$ and $\ell<\lg \left(\bar{t}_{i_{r}}^{r}\right)$ implies $t_{\left(i_{r-1}, \ell\right)}^{r-1} \leqslant T t_{\left(i_{r}, \ell\right)}^{r}$. So $\left(\lg \left(\bar{t}_{i_{r}}^{r}\right): r<\omega\right)$ is constant, say constantly $k$, and if $\ell<k$, then $\left(t_{\left(i_{r}, \ell\right)}^{r}: r<\omega\right)$ is a $\leqslant T_{T}$-sequence. But $x_{r} \notin X_{n_{r}}$ and so $t_{\left(i_{r}, \ell\right)}^{r} \notin T_{n}$, hence $\left(t_{\left(i_{r}, \ell\right)}^{r}: r<\omega\right)$ is $<_{T}$-increasing, and so we reach a contradiction. This concludes the proof of Case 1.
Case 2. The set $Y=\left\{x / E_{1}\right.$ : for some $\left.y \in x / E_{1}, \pi(y) \notin \mathbb{Q} y\right\}$ is finite and $\neq \emptyset$.
Choose $x_{0} \in X$ such that $\pi\left(x_{0}\right) \notin \mathbb{Q} x_{0}$. Let $n<\omega$ be such that $x_{0} \in X_{n}$ and choose $x_{1}$ such that:
$\left(\oplus_{1}\right)$ (a) $x_{1} \in X \backslash \bigcup\left\{y / E_{1}: y \in X_{n}\right\}$;
(b) $\pi\left(x_{1}\right) \in \mathbb{Q} x_{1}$.
[Why possible? By the assumption in Case 2.]
Notice now that:
$\left(\oplus_{2}\right)$ For $\ell \in\{1,2\}, \operatorname{supp}\left(x_{\ell}\right) \subseteq x_{\ell} / E_{1}$.
$\left(\oplus_{3}\right)$ By 5.156 , there are $\left(\bar{t}_{j}, q_{j}: j<j_{*}\right)$ such that:
(a) $\overline{t_{j}}\left(j<j_{*}\right)$ are with no repetitions and $q_{j} \in \mathbb{Q}^{+}$;
(b) $\pi\left(x_{0}+x_{1}\right)=\sum\left\{q_{j} f_{\bar{t}_{j}}\left(x_{0}+x_{1}\right): j<j_{*}\right\}$.
$\left(\oplus_{4}\right)$ We have:
(a) $\pi\left(x_{0}\right)=\sum\left\{q_{j} f_{\bar{t}_{j}}\left(x_{0}\right): j<j_{*}\right\}$;
(b) $\pi\left(x_{1}\right)=\sum\left\{q_{j} f_{\bar{t}_{j}}\left(x_{1}\right): j<j_{*}\right\}$.
[Why? $\pi\left(x_{0}\right)-\sum\left\{q_{j} f_{\bar{t}_{j}}\left(x_{0}\right): j<j_{*}\right\}=-\pi\left(x_{1}\right)+\sum\left\{q_{j} f_{\bar{t}_{j}}\left(x_{1}\right): j<j_{*}\right\}$. Now the LHS has support $\subseteq x_{0} / E_{1}$ and RHS has support $\subseteq x_{1} / E_{1}$. As $x_{0} / E_{1} \cap x_{1} / E_{1}=\emptyset$, both the LHS and the RHS are 0 , and so we are done.]
However $\pi\left(x_{1}\right) \in \mathbb{Q} x_{1}$ by choice, and so:
$\left(\oplus_{5}\right)$ (a) for some $j<j_{*}, \bar{t}_{j}=()$, w.l.o.g. for $j=0$;
(b) for $0<j<j_{*}, \lg \left(\bar{t}_{j}\right)>0\left(\right.$ by $\left(\oplus_{3}\right)($ a) $)$.
$\left(\oplus_{6}\right)$ For $i=0,1$, let $\mathcal{E}_{i}$ be the following equivalence relation on $j_{*}$ :

$$
\left\{\left(j_{1}, j_{2}\right): f_{\bar{t}_{j_{1}}}\left(x_{i}\right)=f_{\bar{t}_{j_{2}}}\left(x_{i}\right)\right\}
$$

$\left(\oplus_{7}\right) 0 / \mathcal{E}_{1}=\{0\}$ and if $0<j<j_{*}$, then:
(a) $\sum\left\{q_{\ell}: \ell \in j / \mathcal{E}_{1}\right\}=0$;
(b) $\sum\left\{q_{\ell} f_{\bar{t}_{\ell}}\left(x_{1}\right): \ell \in j / \mathcal{E}_{1}\right\}=0$.
[Why? Note that:

$$
\sum\left\{q_{\ell} f_{\bar{t}_{\ell}}\left(x_{1}\right): \ell \in j / \mathcal{E}_{1}\right\}=\sum\left\{q_{\ell}: \ell \in j / \mathcal{E}_{1}\right\} f_{\bar{t}_{j}}\left(x_{1}\right)
$$

So if $\sum\left\{q_{\ell}: \ell \in j / \mathcal{E}_{1}\right\} \neq 0$, then $f_{\bar{t}_{j}}\left(x_{1}\right)$ belongs to the support of the RHS of $\left(\oplus_{4}\right)(b)$ but the support of this object is $\left\{x_{1}\right\}$ (by $\left.\left(\oplus_{1}\right)(\mathrm{b})\right)$ and $x_{1} \neq f_{\bar{t}_{j}}\left(x_{1}\right)$, as $\bar{t}_{j} \neq()$, together we reach a contradiction, and so we have $\left.\left(\oplus_{7}\right)(\mathrm{a})(\mathrm{b}).\right]$
$\left(\oplus_{8}\right) E_{1}$ refines $E_{0}$.
[Why? Assume that $j_{1}, j_{2}<j_{*}$ and $j_{1} \mathcal{E}_{1} j_{2}$, this means that $f_{\bar{t}_{j_{1}}}\left(x_{1}\right)=f_{\bar{t}_{j_{2}}}\left(x_{1}\right)$. By $5.2 \cup \mathrm{j})$, as $x_{1} \notin X_{n}$ we have that $X_{n} \subseteq \operatorname{dom}\left(f_{\bar{t}_{j_{1}}}\right) \cap \operatorname{dom}\left(f_{\bar{t}_{j_{2}}}\right)$ and $f_{\bar{t}_{j_{1}}} \upharpoonright X_{n}=f_{\bar{t}_{j_{2}}} \upharpoonright$ $X_{n}$. As $x_{0} \in X_{n}$ we get that $f_{\bar{t}_{j_{1}}}\left(x_{0}\right)=f_{\bar{t}_{j_{2}}}\left(x_{0}\right)$, which means $j_{1} \mathcal{E}_{0} j_{2}$, as desired.]
$\left(\oplus_{9}\right) 0 / E_{0}=\{0\}$ and if $0<j<j_{*}$, then:
(a) $\sum\left\{q_{\ell}: \ell \in j / \mathcal{E}_{0}\right\}=0$;
(b) $\sum\left\{q_{\ell} f_{\bar{t}_{0}}\left(x_{\ell}\right): \ell \in j / \mathcal{E}_{0}\right\}=0$.
[Why? By $\left(\oplus_{7}\right)+\left(\oplus_{8}\right)$, recalling 5.2 (j).]
$\left(\oplus_{10}\right) \pi\left(x_{0}\right)=q_{0} x_{0}$ (follows by $\left.\left(\oplus_{9}\right)(\mathrm{b})\right)$.
But $\left(\oplus_{10}\right)$ contradicts our choice of $x_{0}$, as $\pi\left(x_{0}\right) \notin \mathbb{Q} x_{0}$.
Case 3. The set $Y=\left\{x / E_{1}\right.$ : for some $\left.y \in x / E_{1}, \pi(y) \notin \mathbb{Q} y\right\}$ is empty.
For $x \in X$, let $\pi(x)=q_{x} x$. Now, first of all we claim:
$\left(\star_{0.1}\right)$ If $a \in G_{1}^{+}, \pi(a)=0$ and $x / E_{1} \cap \operatorname{supp}(a)=\emptyset$, then $\pi(x)=0$.
[Why? Let $p=p_{x+a}$. Firstly, notice that $\pi(x+a)=\pi(x)+\pi(a)=q_{x} x$. Secondly, recalling that $x / E_{1} \cap \operatorname{supp}(a)=\emptyset$, notice that by 5.152 we have that $x \notin G_{(1, p)}$, but this contradicts that $x+a \in G_{(1, p)}$, as $\pi(x+a)=q_{x} x$.]
$\left(\star_{0.2}\right)$ If $\pi$ is not 1-to- 1 , then $\pi$ of the form $a \mapsto 0$, for all $a \in G_{1}$.
[Why? Let $a \in G_{1}^{+}$be such that $\pi(a)=0$. If $y \in X \backslash \operatorname{supp}(a)$, then we get that $\pi(y)=0$, by applying $\left(\star_{0.1}\right)$ to $(a, y)$. If $y \in \operatorname{supp}(a)$, choose $x \in X \backslash \operatorname{supp}(a)$ and apply $\left(\star_{0.1}\right)$ to $(x, y)$.]
$\left(\star_{0.3}\right)$ W.l.o.g. $\pi$ is 1-to-1.
[Why? Otherwise, by $\left(\star_{0.2}\right), \pi$ is multiplication by an integer and so we are done.] $\left(\star_{1}\right)\left(q_{x}: x \in X\right)$ is constant.
Why $\left(\star_{1}\right)$ ? Choose $x_{0}, x_{1} \in X$ such that $q_{x_{0}} \neq q_{x_{1}}$ and, if possible, they are both $\neq 0$. Let $n<\omega$ be such that $x_{0}, x_{1} \in X_{n}$ and choose a $<_{X}$-minimal $x_{2} \in X_{n+1} \backslash X_{n}$, possible by 5.9 2). Let $a=x_{0}+x_{1}+x_{2}, p=p_{a}$ (cf. 5.13) and $\bar{x}=\left(x_{0}, x_{1}, x_{2}\right)$. As $a \in G_{(1, p)}$ and $\pi \in \operatorname{End}\left(G_{1}\right)$, clearly $\pi(a)=b \in G_{(1, p)}$ and so by 5.15(6) there are $j<\omega$ and, for $i<j, \bar{y}^{i} \in \operatorname{seq}_{3}(X)$ and $q^{i} \in \mathbb{Q}^{+}$such that $\bar{x} \leqslant{ }_{X}^{3} \bar{y}^{i}$ and:
$\left(\star_{1.1}\right) b=\sum_{i<j} q^{i}\left(\sum_{\ell<3} y_{\ell}^{i}\right)$.
Notice that by $\left(\star_{0.2}\right)$ we have $j>0$ and w.l.o.g. we can assume that for $i<j-1$ we have $\bar{y}^{j-1} \not_{X}^{3} \bar{y}^{i}$ and also that $\bar{x}$ is reasonable (so the $\bar{y}^{i}$ 's are also reasonable). Also:
$\left(\star_{1.2}\right) b=\pi(a)=q_{x_{0}} x_{0}+q_{x_{1}} x_{1}+q_{x_{2}} x_{2}$.

As $i<j-1$, implies $\bar{y}^{j-1} \nless X_{X}^{3} \bar{y}^{i}$, clearly $y_{2}^{j-1} \notin\left\{y_{\ell}^{i}: i<j-1, \ell \leqslant 2\right\} \cup\left\{y_{0}^{j-1}, y_{1}^{j-1}\right\}$ (by 5.99 9 and $\bar{y}^{j-1} \in \operatorname{seq}_{3}(X)$ ), and so $y_{2}^{j-1}$ appears exactly once in the RHS of equation ( $\star_{1.1}$ ), and so it appears in LHS of $\left(\star_{1.1}\right)$, so $y_{2}^{j-1} \in \operatorname{supp}(b) \subseteq\left\{x_{0}, x_{1}, x_{2}\right\}$. But $x_{2} \notin x_{0} / E_{1} \cup x_{1} / E_{1}$, as $x_{0}, x_{1} \in X_{n}$ and $x_{2} \in X_{n+1} \backslash X_{n}$ is $<x^{-m i n i m a l}$. On the other hand, clearly $y_{\ell}^{i} \in x_{\ell} / E_{1}$ for $\ell \leqslant 2$ and $i<j$. Hence, necessarily, $y_{2}^{j-1}=x_{2}$. Finally, as $x_{2}$ is $<_{X}$-minimal and for some $\bar{t} \in T^{<\omega}, f_{\bar{t}}(\bar{x})=\bar{y}^{j-1}$, necessarily, $f_{\bar{t}}\left(x_{2}\right)=y_{2}^{j-1}$, so clearly $\bar{t}=()$. Hence, $\bar{y}^{j-1}=\bar{x}$ and of course $\bar{x} \leqslant_{X}^{3} \bar{y}$ implies $f_{\bar{t}}(\bar{x}) \leqslant_{X}^{3} \bar{y}$. Thus, by the statement after $\left(\star_{1.1}\right), j=1$ and $\bar{y}^{0}=\bar{x}$. So we have:
$\left(\star_{1.3}\right) q_{x_{0}} x_{0}+q_{x_{1}} x_{1}+q_{x_{2}} x_{2}=q^{0}\left(y_{0}^{0}+y_{1}^{0}+y_{2}^{0}\right)=q^{0}\left(x_{0}+x_{1}+x_{2}\right)$.
Thus, $q_{x_{0}}=q^{0}=q_{x_{1}}$, contradicting our assumption that $q_{x_{0}} \neq q_{x_{1}}$.
$\left(\star_{2}\right)$ Let $q_{x}=q_{*}$ for $x \in X$ (recalling $\left(\star_{1}\right)$ ).
$\left(\star_{3}\right) q_{*}$ is an integer.
Why $\left(\star_{3}\right)$ ? Let $q_{*}=\frac{m}{n}$, with $m, n \in \mathbb{Z}^{+}, m$ and $n$ coprimes. Suppose that there is a prime $p$ such that $p \mid n$. Then we easily reach a contradiction noticing that:
(.) if $x \in X$ is $<_{1}$-minimal and $r$ is a prime different from $p_{x}$, then $r \not \backslash x$;
(.) there are $<_{1}$-minimal $x, y \in X$ such that $x \neq y$.

It follows that $n=1$ and so $\left(*_{3}\right)$ holds.
Hence, our proof is complete, as Cases 1 and 2 are contradictory, while in Case 3 we showed that the arbitrary $\pi \in \operatorname{End}\left(G_{1}\right)$ is indeed multiplication by an integer.

Remark 5.17. Notice that, in the proof of 5.16, Cases 2 and 3 do not use the assumption that $T$ is well-founded and so for an arbitrary tree $T$ (as in 5.1) and $\pi \in \operatorname{End}\left(G_{1}[T]\right)$ we have:
(a) Case 1 happens if only if $T$ is not well-founded;
(b) Case 2 never happens;
(c) if Case 3 happens, then $\pi$ is multiplication by an integer.

Research of the first author partially supported by project PRIN 2017 "Mathematical Logic: models, sets, computability", prot. 2017NWTM8R. Research of the second author partially supported by Israel Science Foundation (ISF) grant no: 1838/19. We would like to thank C. Laskowski, D. Ulrich, and the anonymous referee for useful comments that lead to a simplification of the main construction of this paper.

[^1]:    ${ }^{1}$ As already mentioned in [4], this result is actually a straightforward adaptation of a model theoretic construction due to Mekler [11].

[^2]:    ${ }^{2}$ The reason is that we want to force that $g \neq g^{-1}$.
